

# Science Applications Enabled by the IGS

Markus Rothacher

Institute of Geodesy and Photogrammetry, ETH Zurich

IGS Workshop 2014

“Celebrating 20 years of operational IGS service”

Pasadena, June 23, 2014

# Overview

- **Motivation: Two Challenges**
  - slow processes (years to decades)
  - fast processes (seconds to hours)
- **Products of the IGS for these challenges**
- **Science:**
  - Solid Earth: plate tectonics ↔ earthquakes
  - Atmosphere: “climate” ↔ weather prediction
  - Precise LEO orbit determination for EO satellite missions
- **Challenges for the IGS**
- **Conclusions**

# Motivation: Two Challenges

# Two Major Challenges Global Earth Monitoring

## *Reliable detection of small, long-term trends:*

- Sea level rise
- Glacial Isostatic Adjustment (GIA)
- Plate tectonics
- Global change: water vapor, troposphere height)

## *Fast event detection and quantification:*

- Earthquakes, tsunami
- Volcanic eruptions
- Landslides
- Hurricanes
- Space weather

# Contrast in IGS Service: Postprocessing - Real-Time

## *Reliable detection of small, long-term trends:*

- Post- or re-processing
- Long time series
- IGS: reprocessing effort
- IGS: final products, reference frame solutions
- Global network solutions
- Highest accuracy and consistency (1-5 mm)

## *Fast event detection and quantification:*

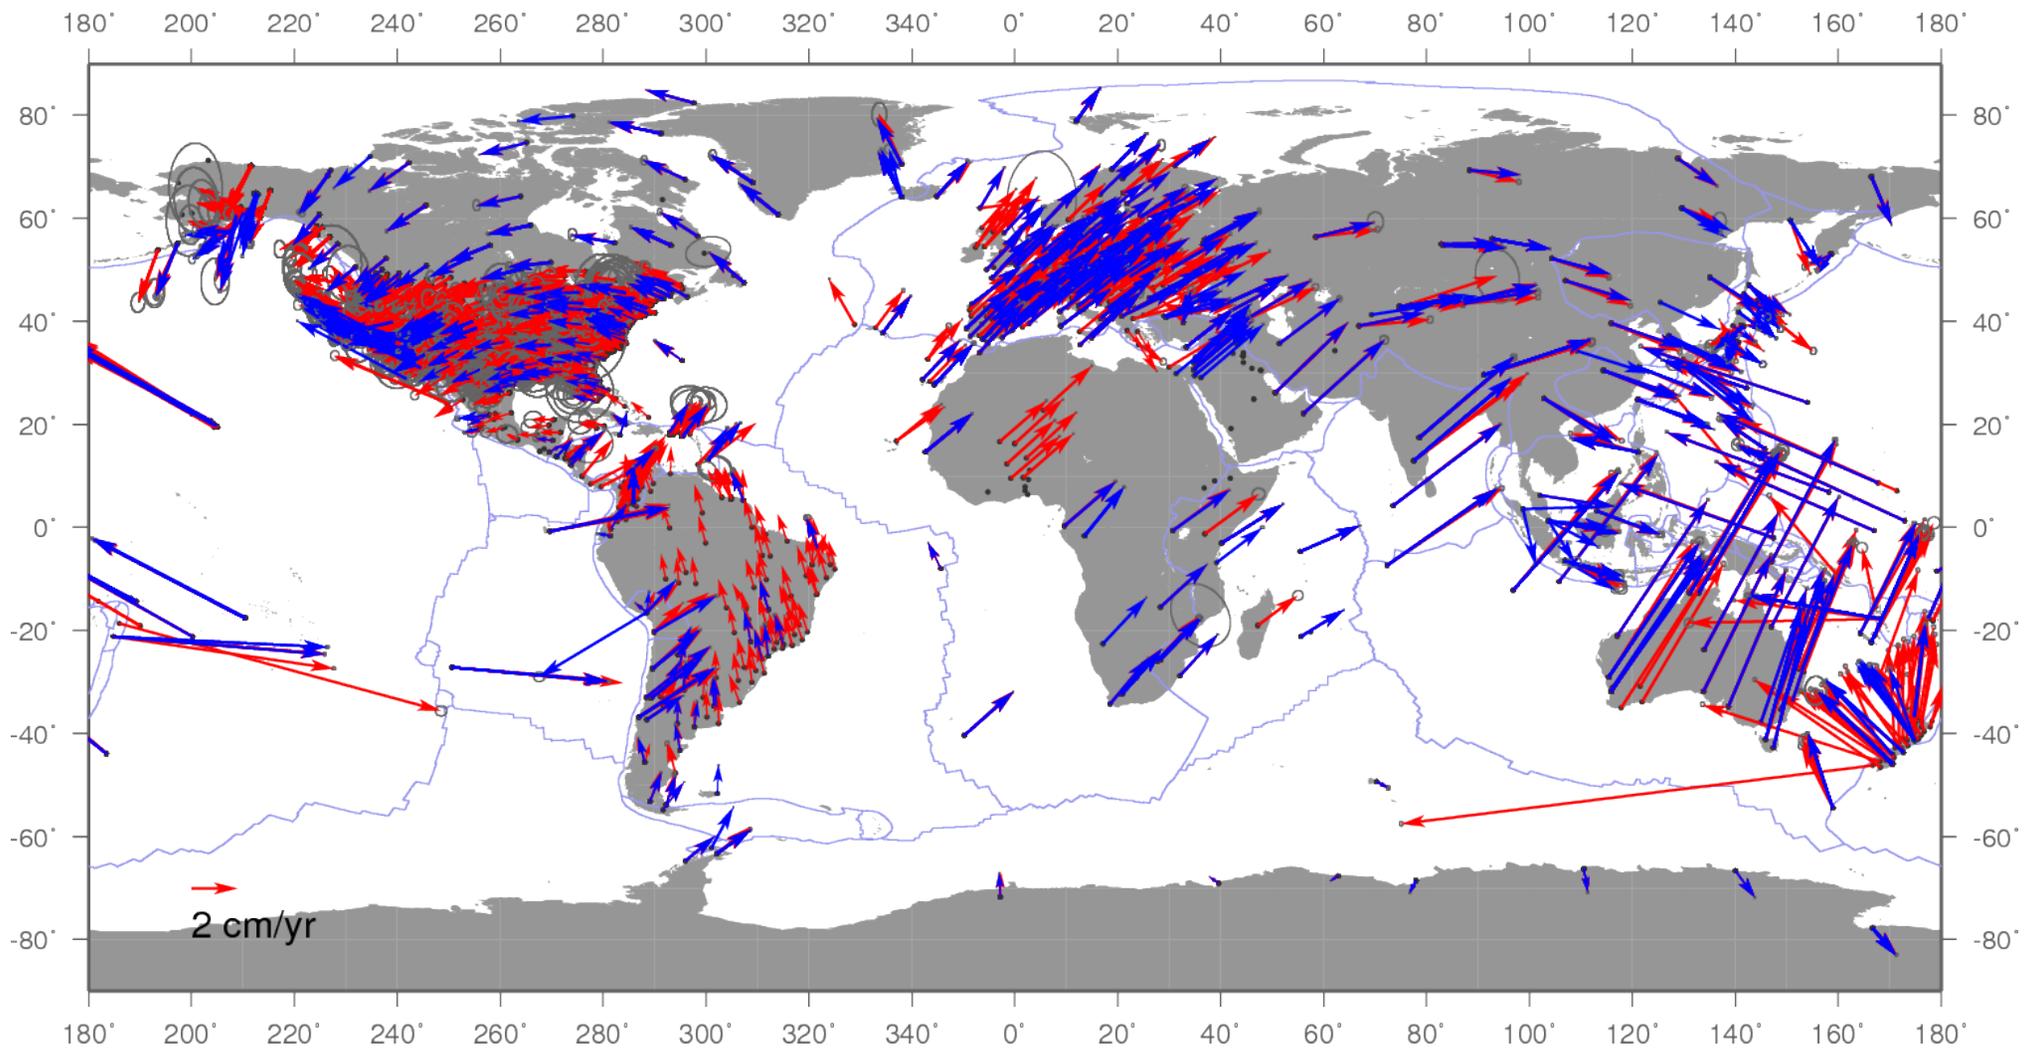

- (Near) real-time processing
- Real-time data streams
- IGS: real-time project
- IGS: predicted orbits, real-time clocks
- PPP
- Lower accuracy (2-10 cm)

**→ IGS is providing products for both challenges**

# Solid Earth:

Plate Tectonics ↔ Earthquakes

# Long-Term Trends: Plate Tectonics, Global Velocity Field

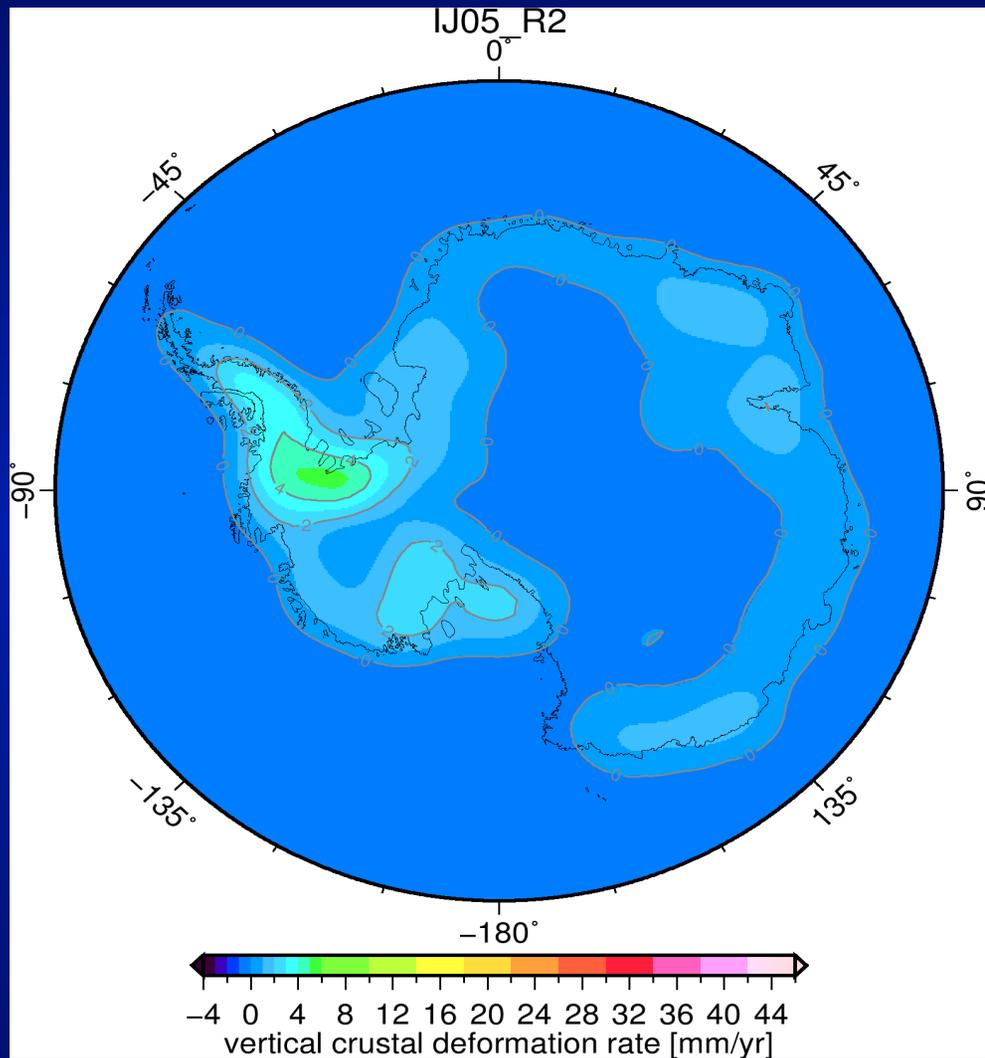

**ITRF2008**

**GPS Core networks**

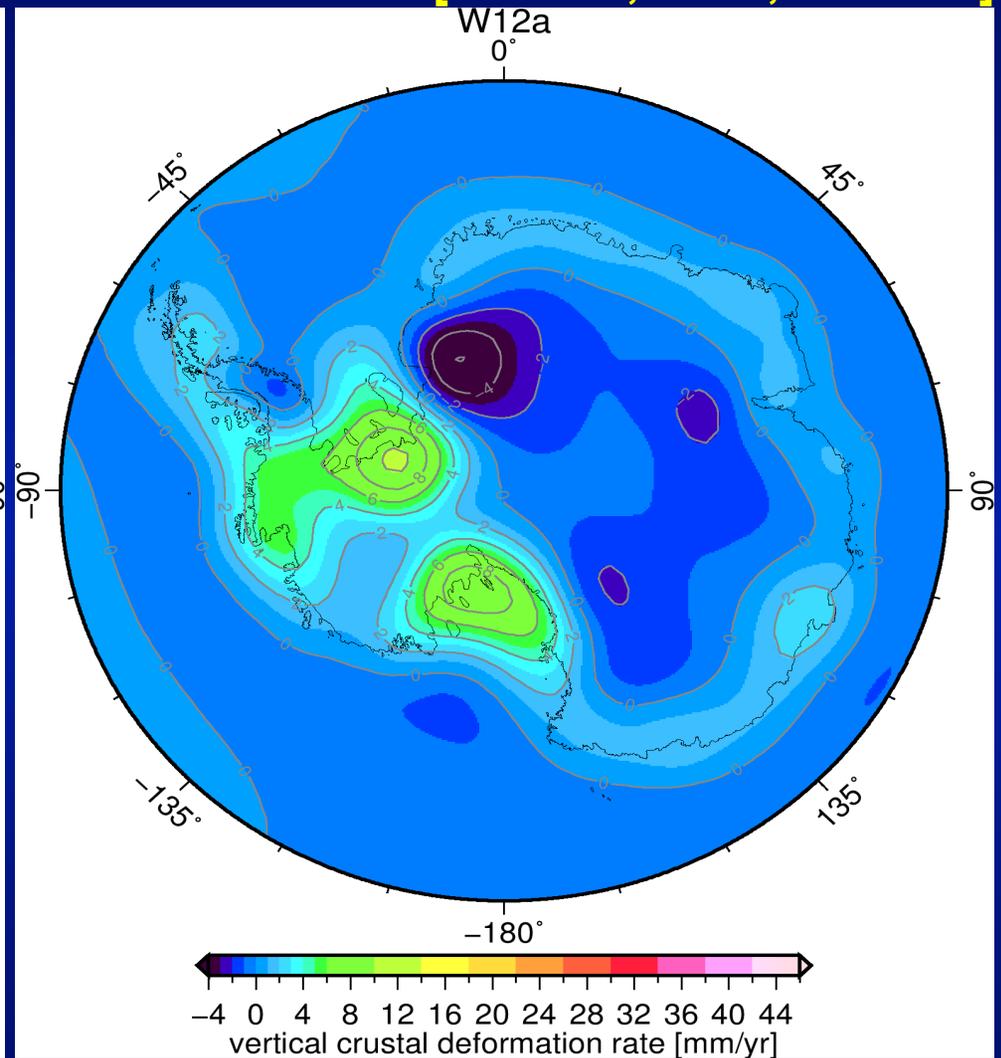

[Bruyninx et al., 2011] IAG WG on Regional Dense Velocity Fields

# Long-Term Trends: Vertical Crustal Deformation: GIA

[Dietrich, Groh, Fritsche]

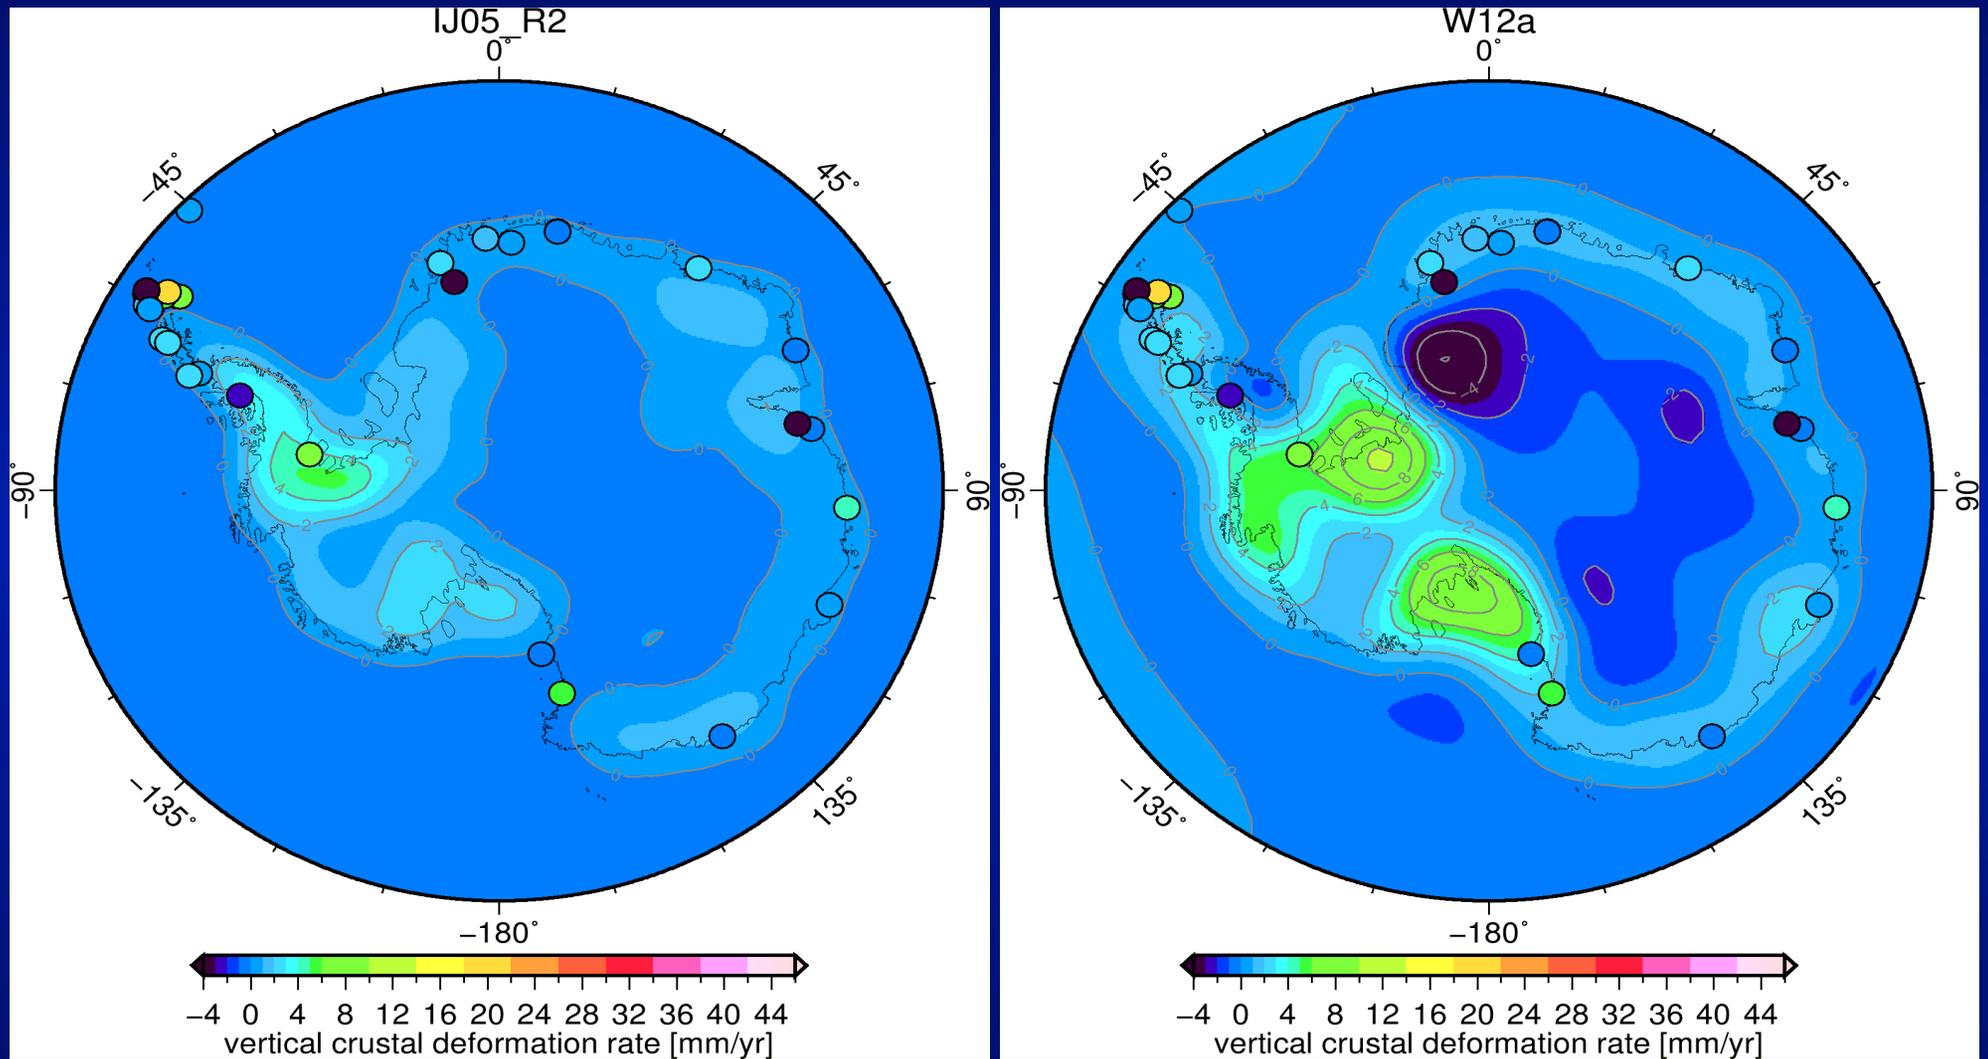

Ivins et al. (2013)

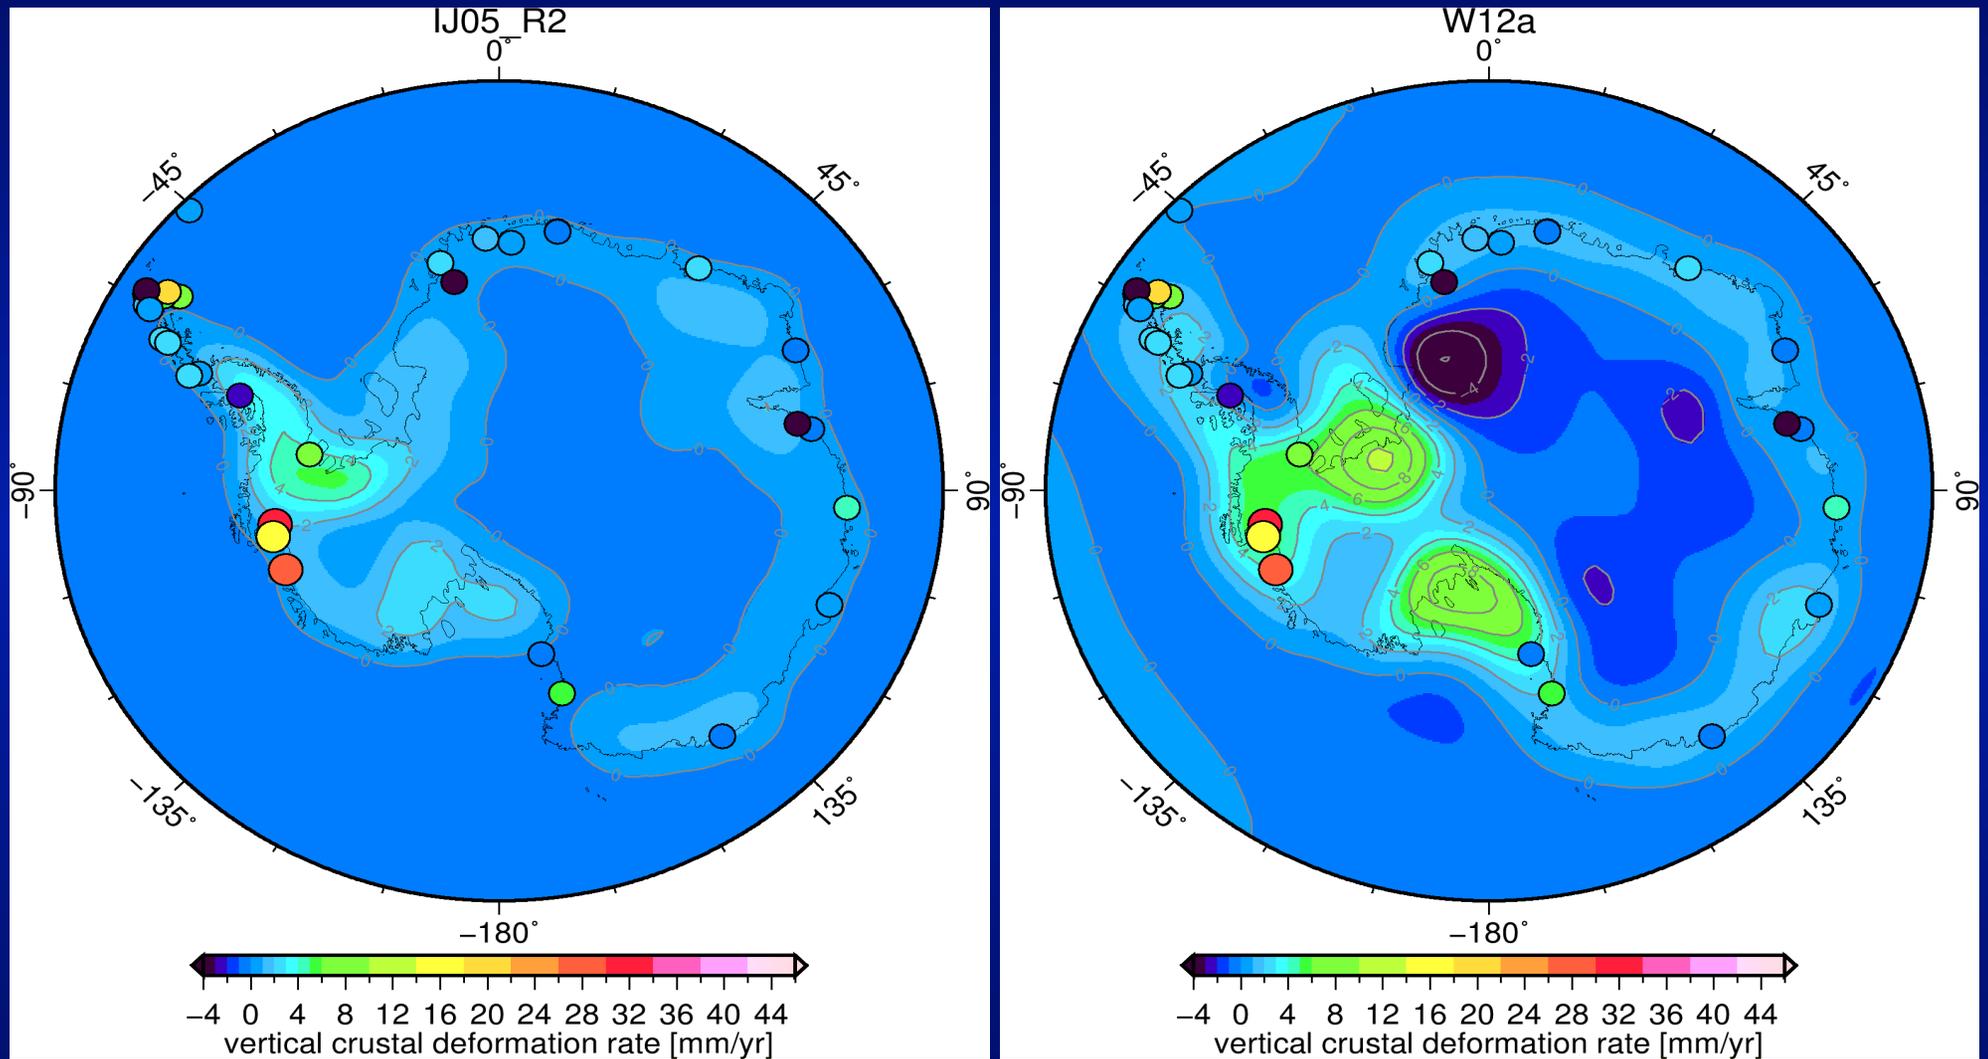

Whitehouse et al. (2012)

# Vertical Crustal Deformation: GIA vs. GPS

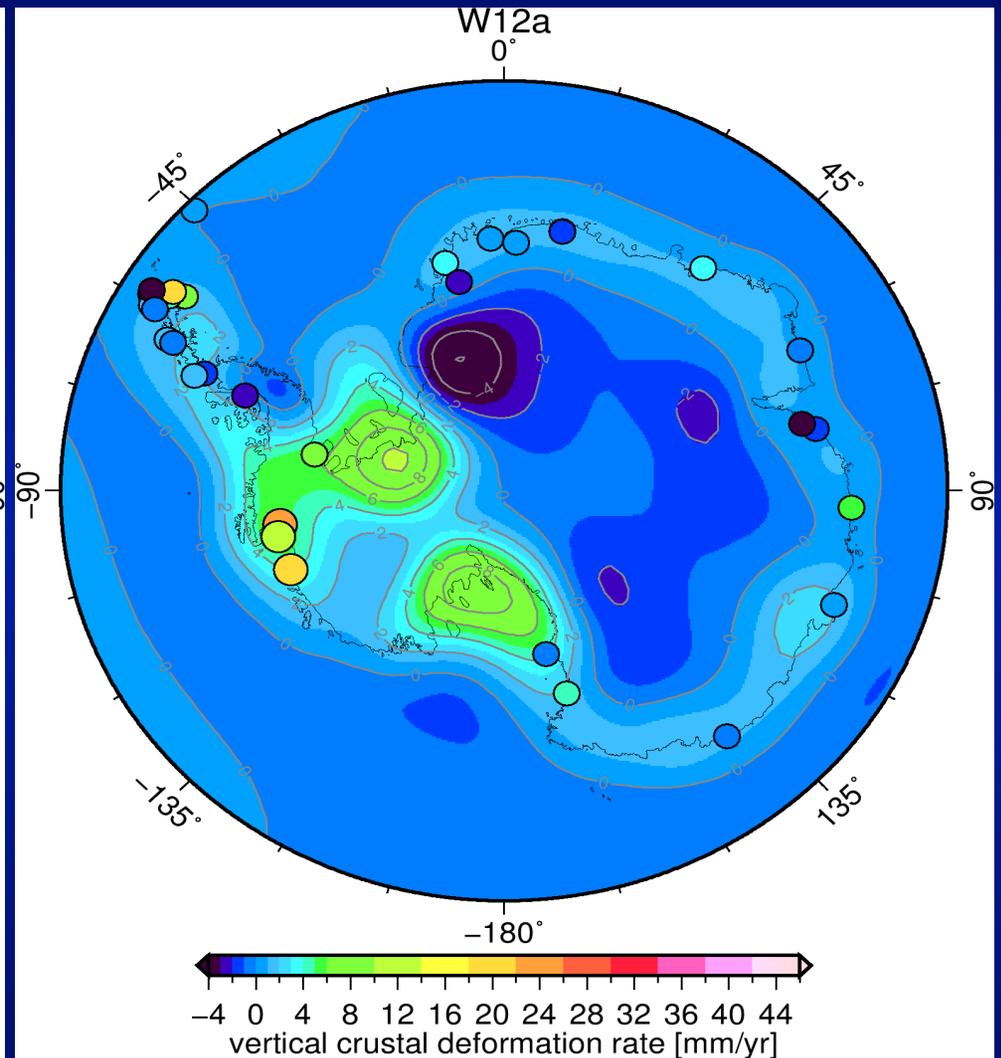

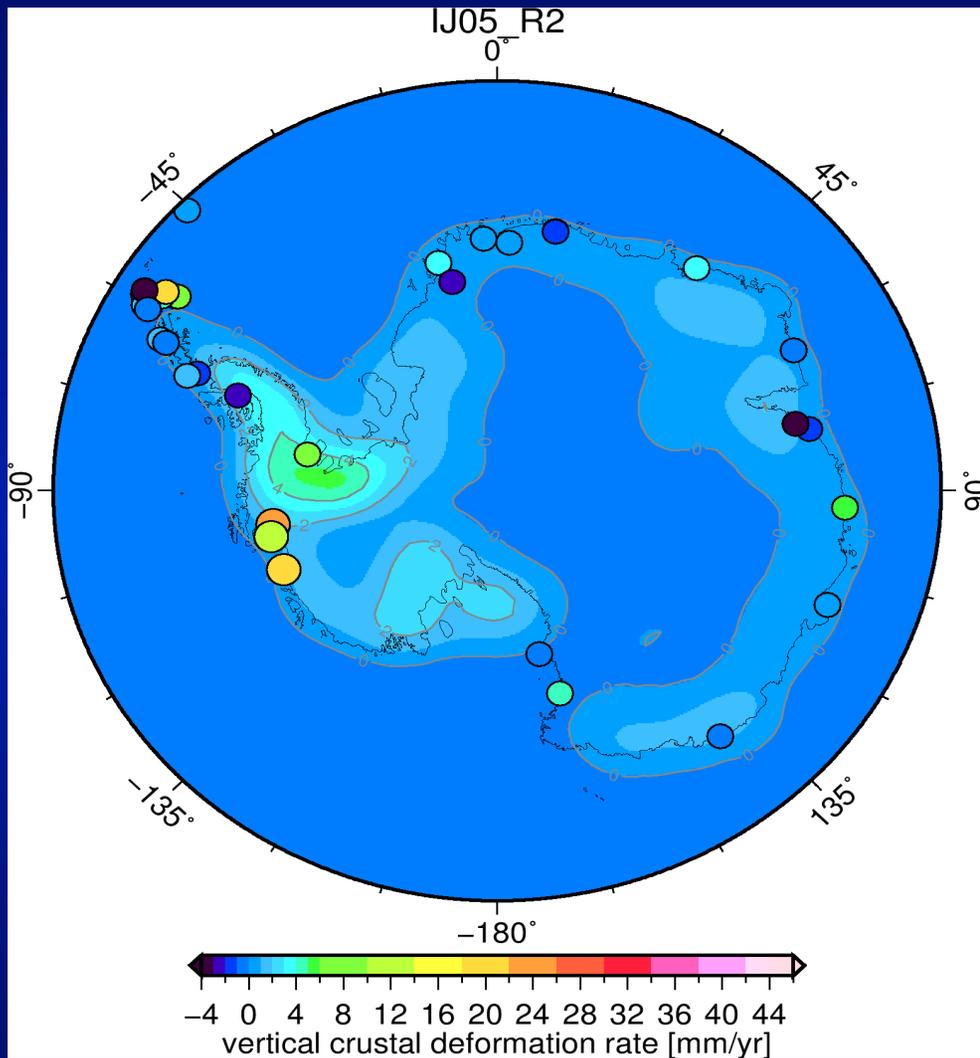

[Dietrich, Groh, Fritsche]

# Vertical Crustal Deformation: GIA vs. GPS

[Dietrich, Groh, Fritsche]

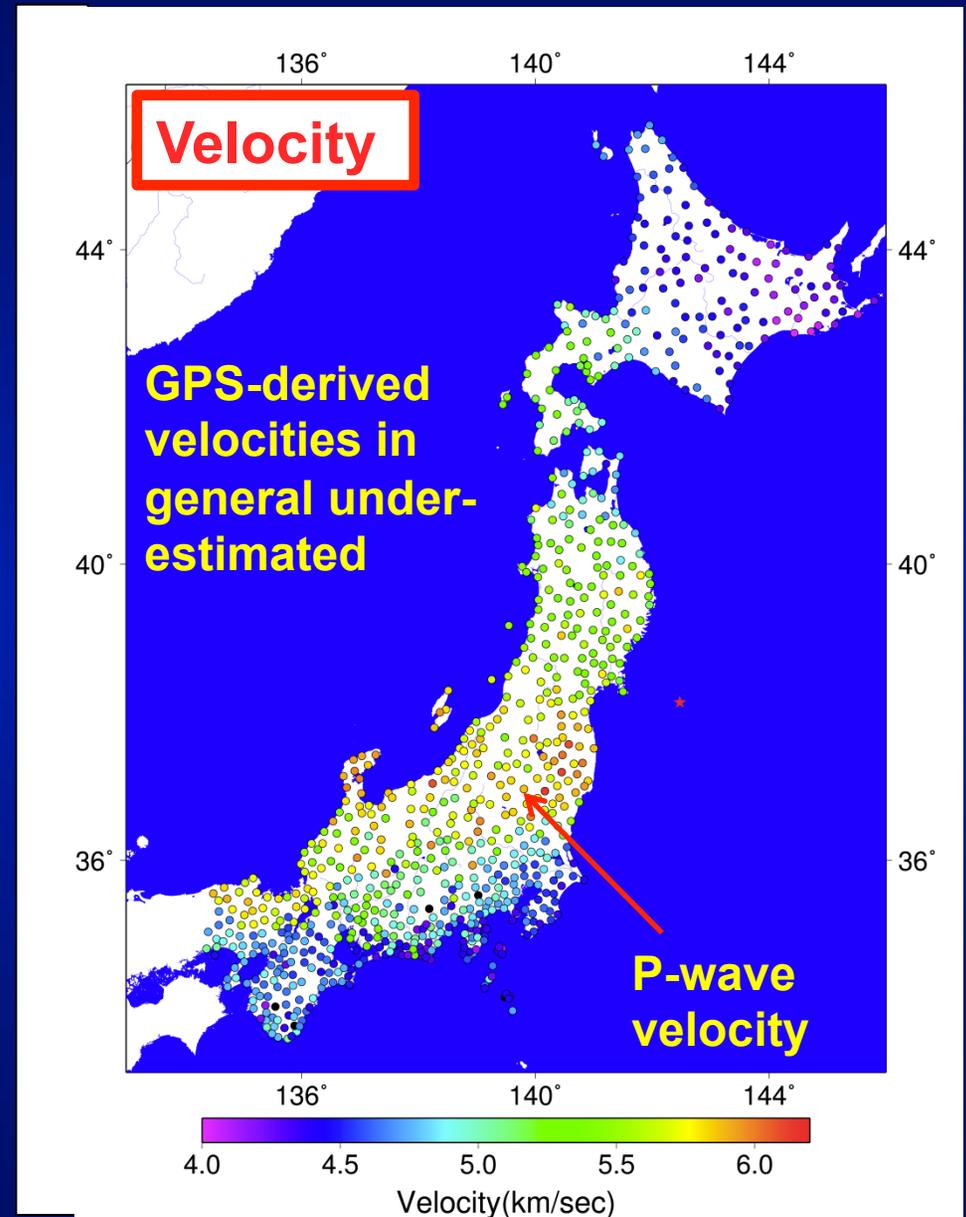

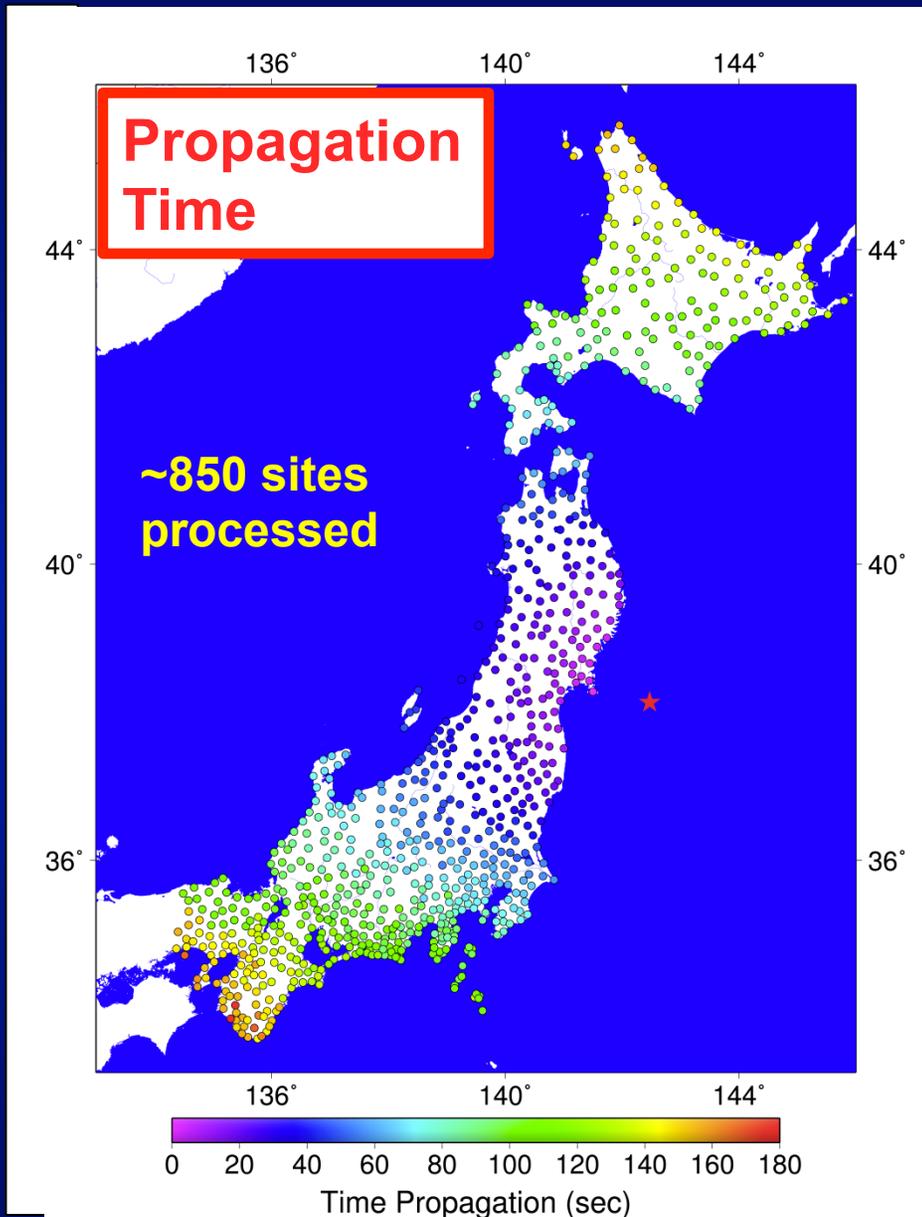

# Vertical Crustal Deformation: GIA vs. GPS

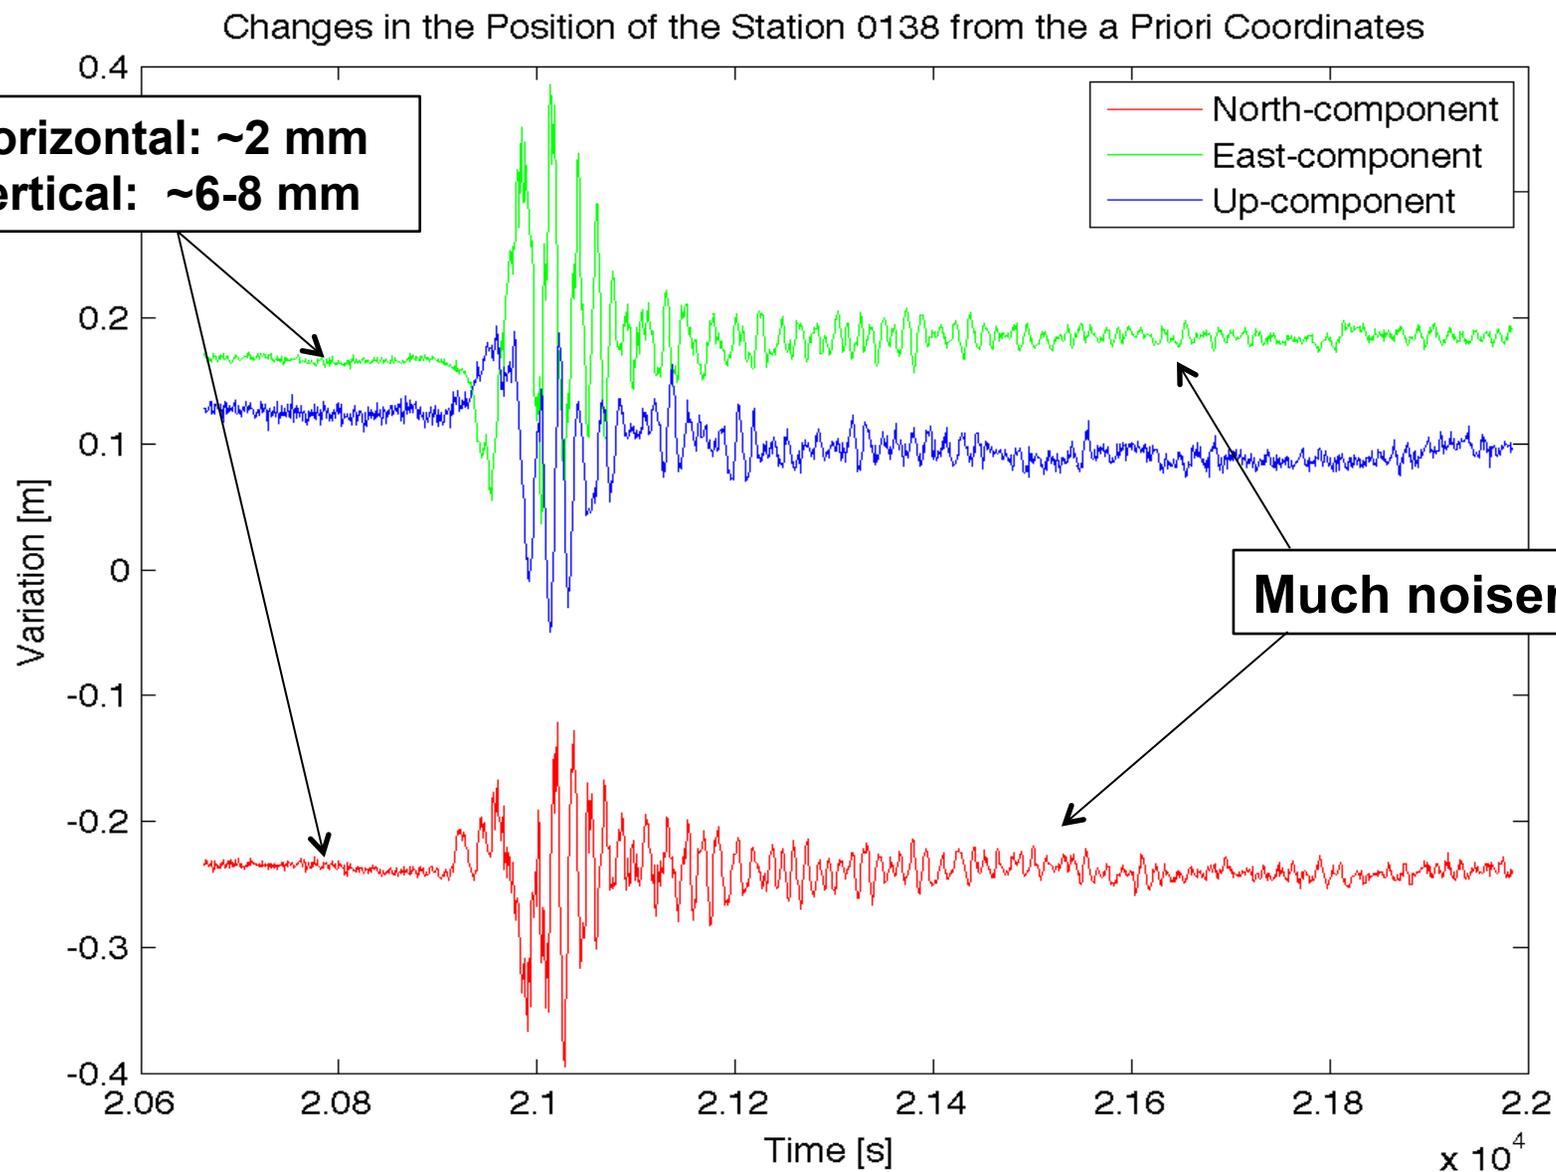

elastic correction applied for current mass loss

[Dietrich, Groh, Fritsche]

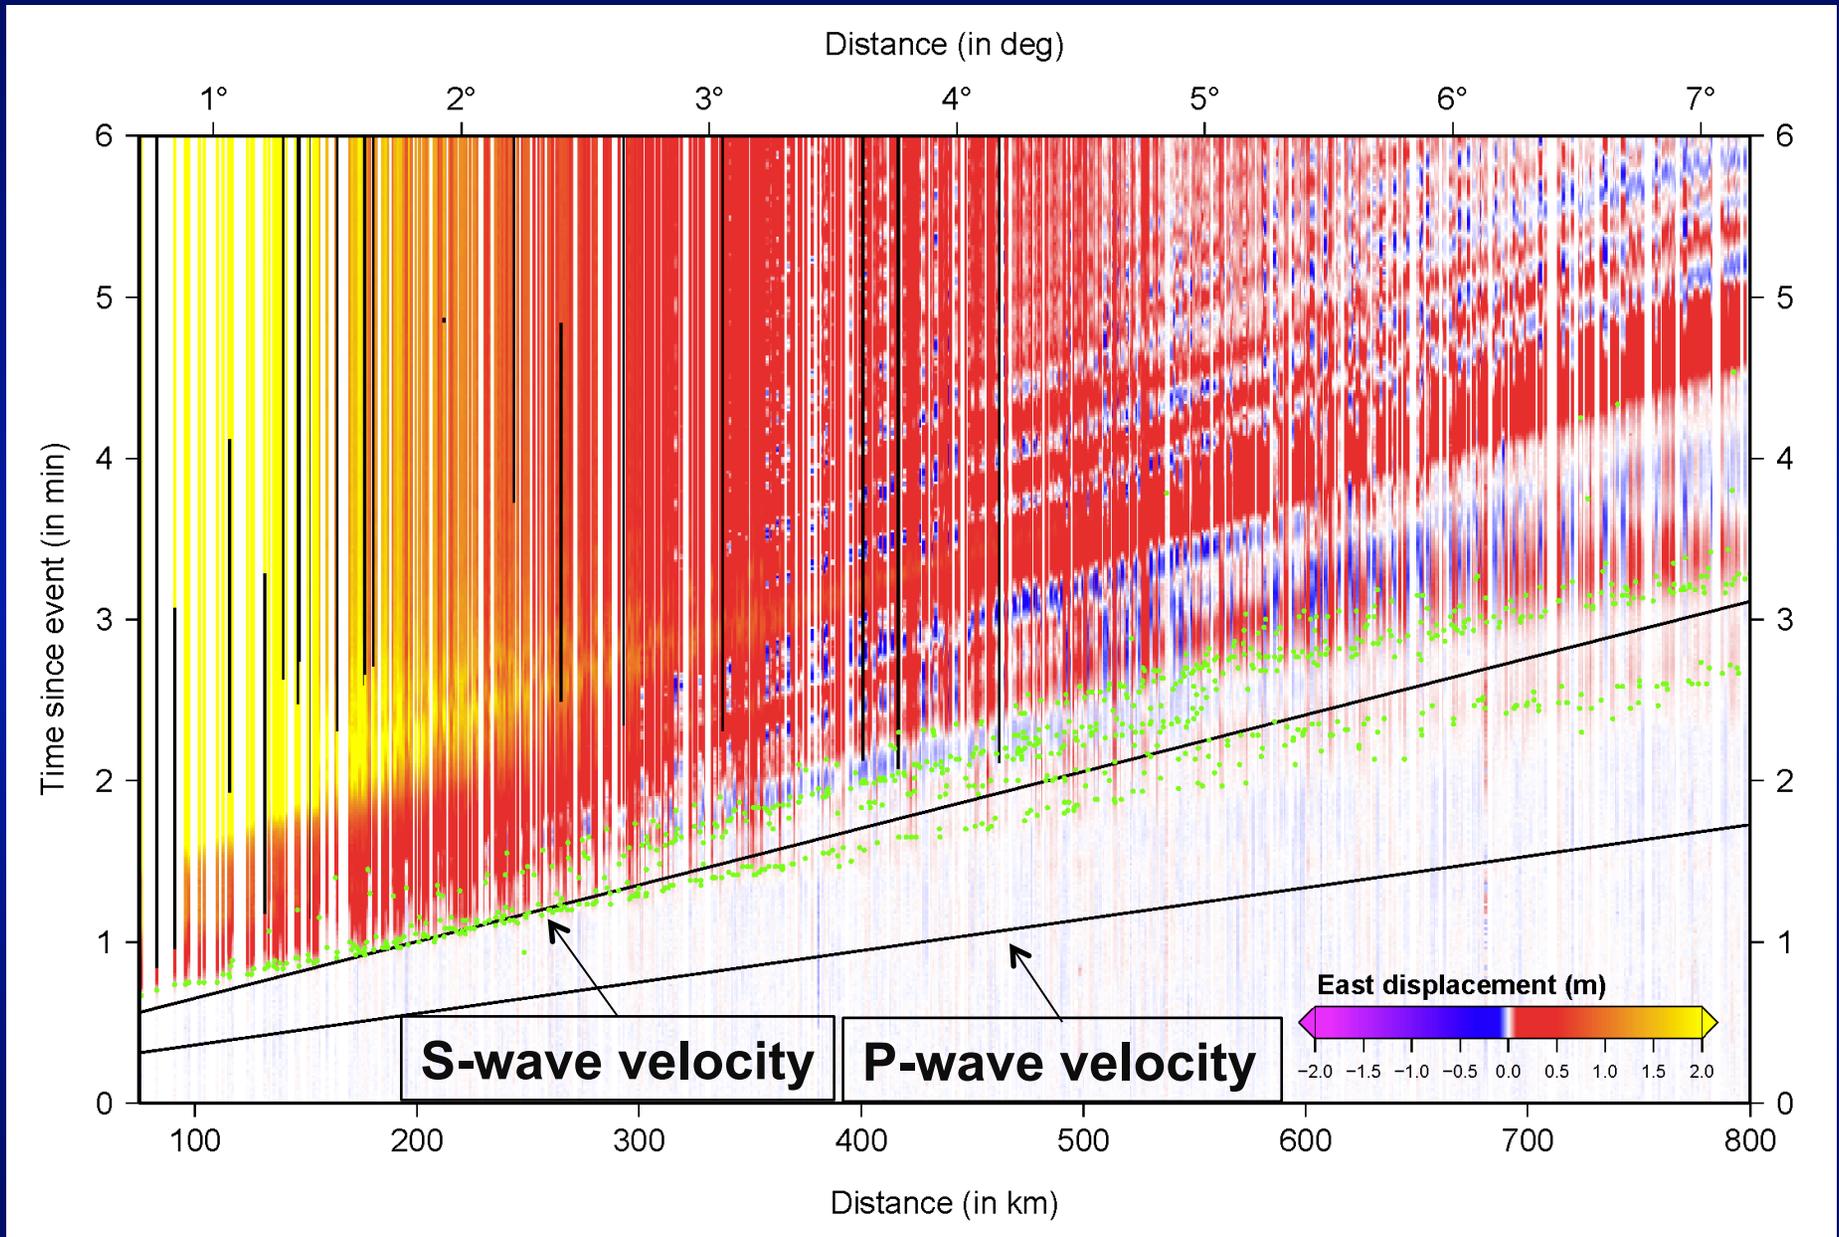

# Fast Detection: Tohoku-Oki with 1Hz PPP

# Example of the kinematic GPS Results with PPP

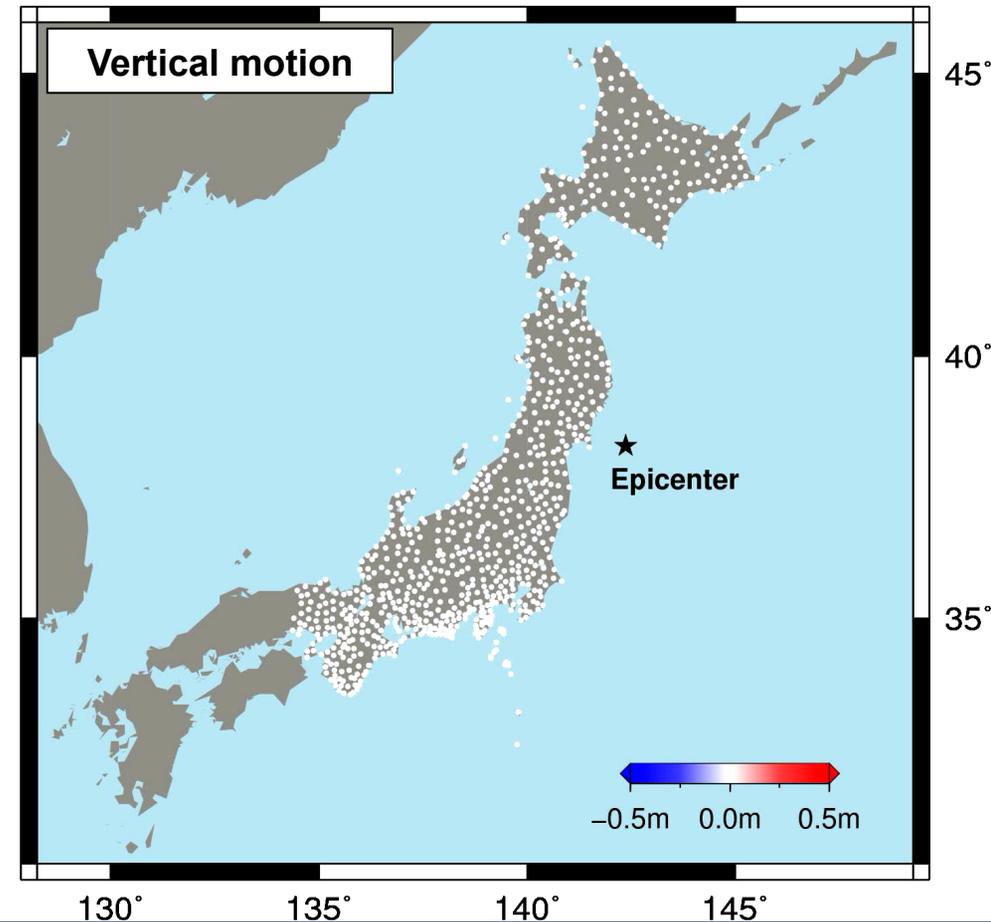

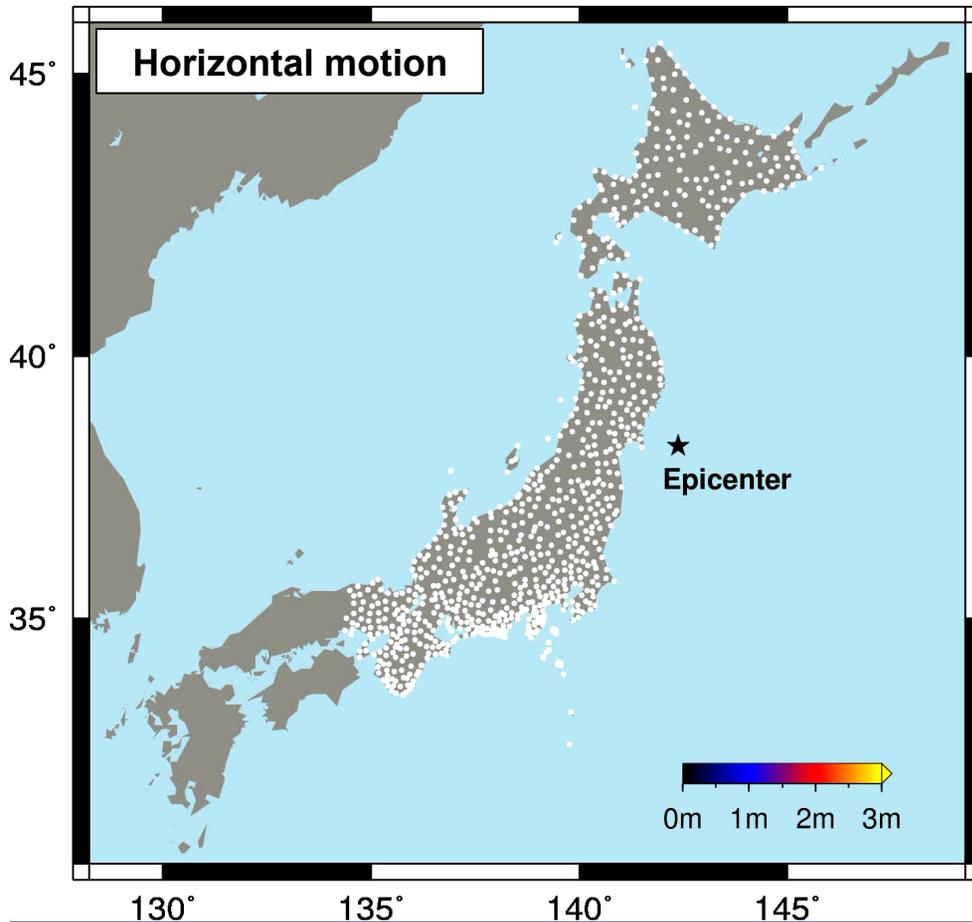

# Tohoku-Oki Earthquake: East Displacements and Waves

# Fast Event Detection: Closer and Closer to Real-Time Earthquake ground displacements with GNSS, early warning

Time since earthquake: 00 m 00 s

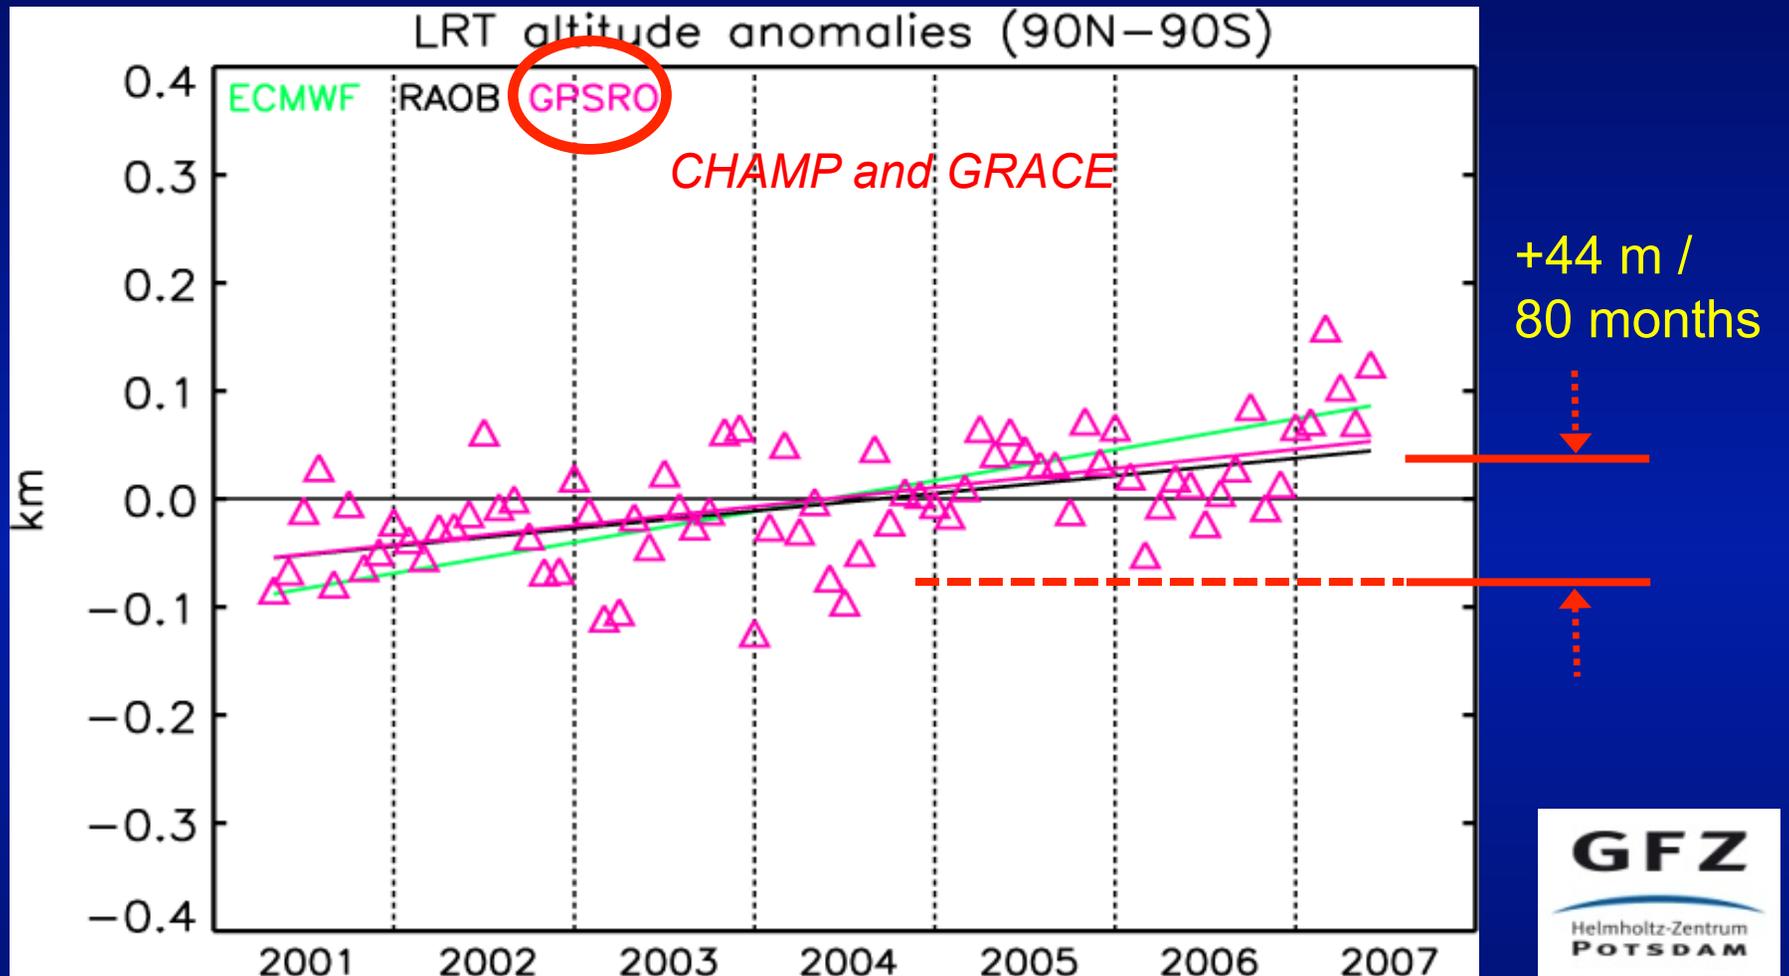

**GPS 1-Hz, Tohoku-Oki earthquake**

G. Blewitt et al., GRL, 2006 → rapid magnitude determination etc.

**Atmosphere:**

**„Climate“ ↔ Weather Forecast**

# Reliable Detection of Long-Term Trends: Climatology: Height of the Tropopause

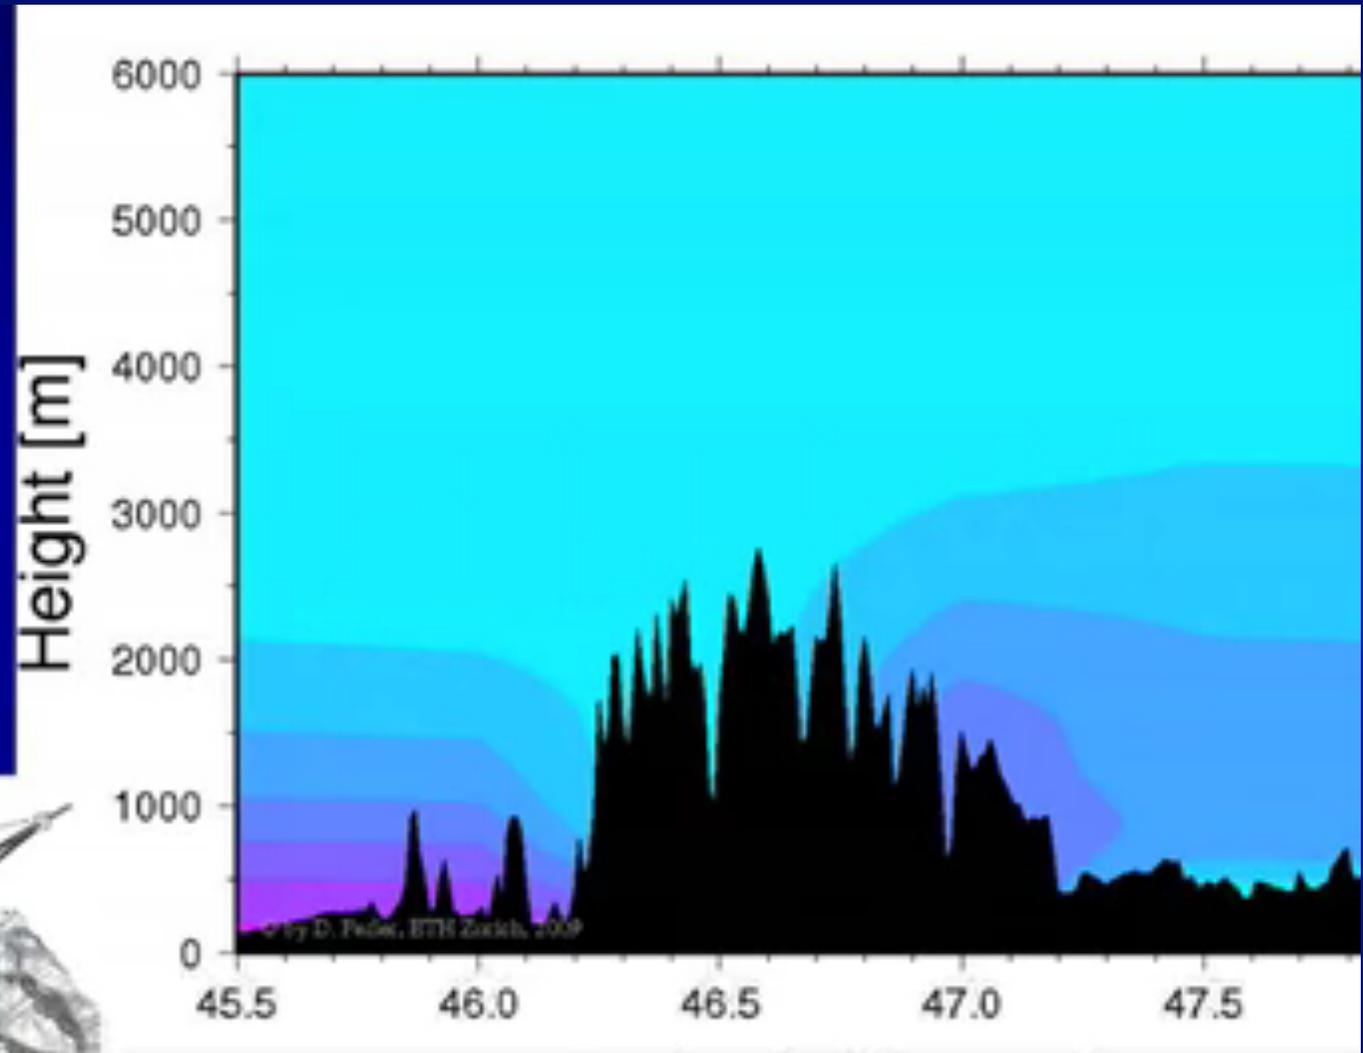

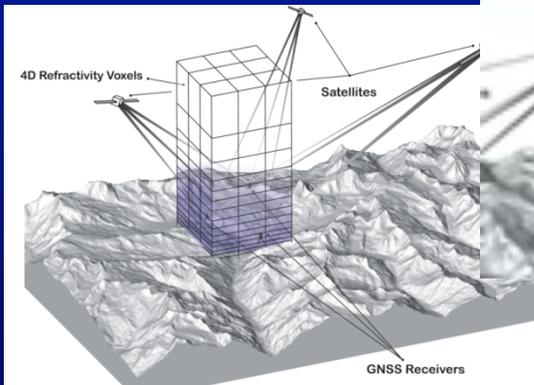

Increase  $\sim 66$  m/decade, in agreement with global RS data (e.g. Seidel/  
Randel 2006,  $\sim 64$  m/decade 1980-2004)

[Schmidt et al, 2008]

# Fast: Water Vapour Tomography with Ground-Based GPS

**AGNES:**  
Swiss GNSS  
permanent  
network

→ weather  
forecast

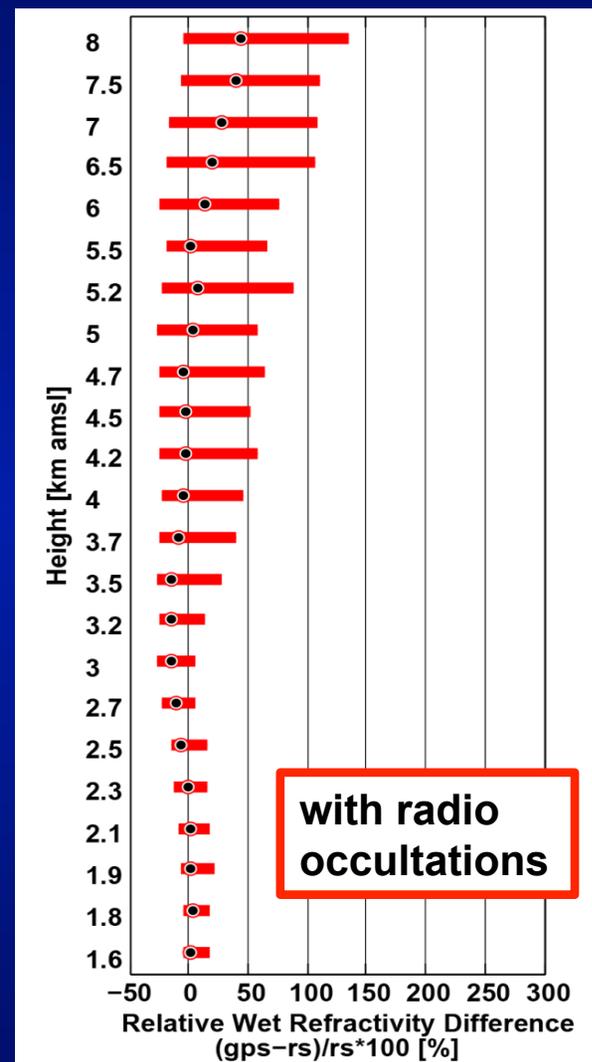

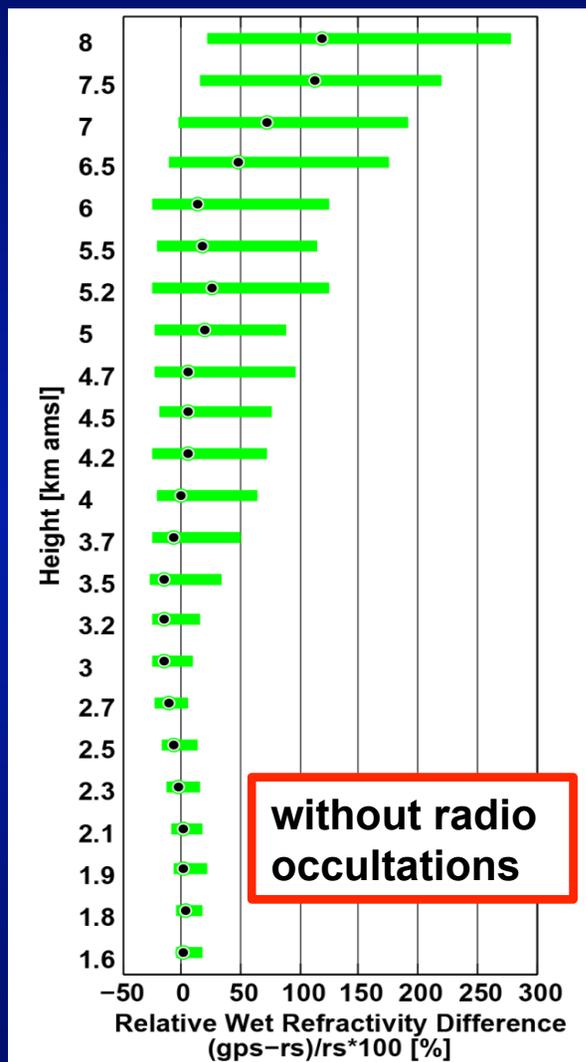

[D. Perler, 2011]

# Combination of Water Vapor Profiles from Ground-Based GPS with Radio Occ.

GPS + Ground meteo

Comparison with radiosonde data at Payerne in Switzerland: 2132 profiles over 3 years

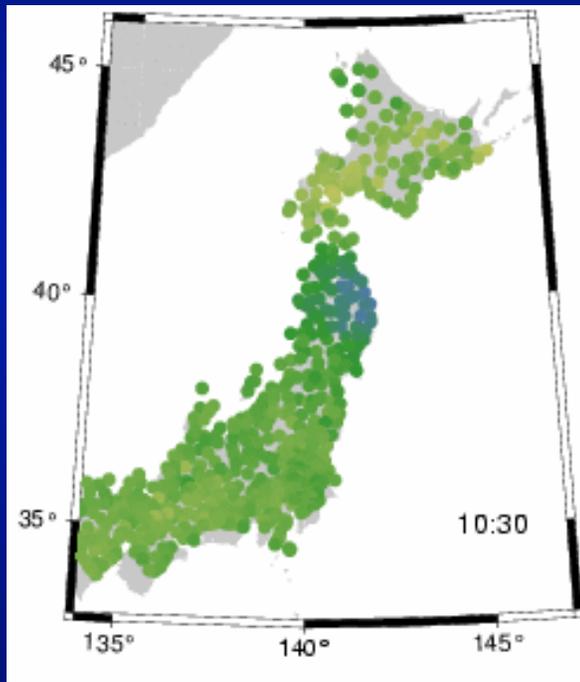

IGS Final Orbits used for both, ground-based GNSS tomography and GNSS radio occultations

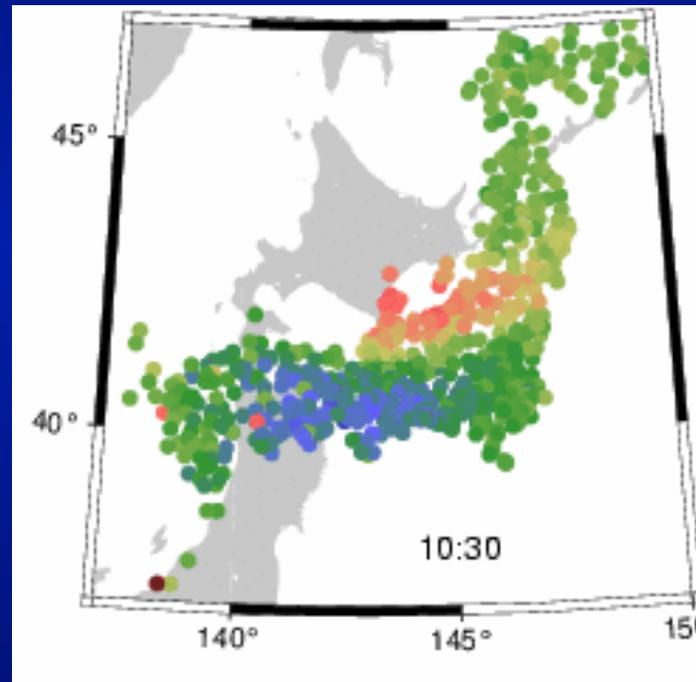

[F. Hurter & O. Maier, 2013]

# Fast Detection: Earthquake Visible in the Ionosphere

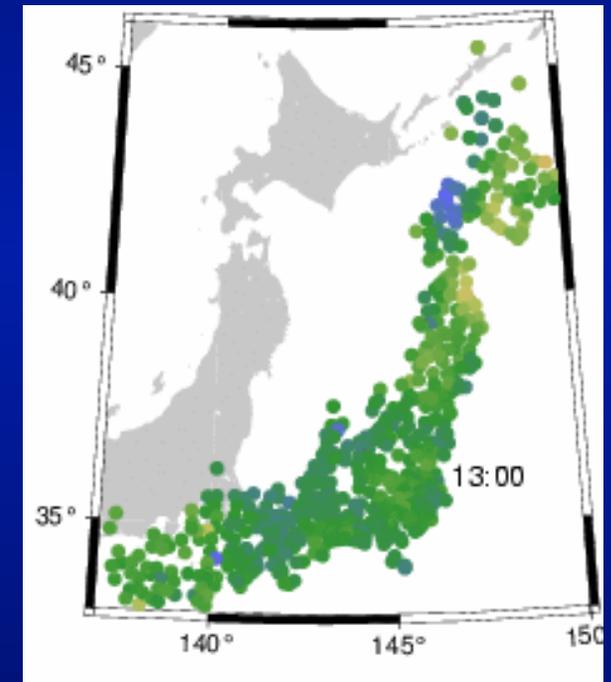

- Co-seismic acoustic waves propagating through the ionosphere
- 2003 Tokachi-Oki earthquake, Hokkaido (Mw=8.0)
- Ionospheric delays for different satellites, stations of the Japanese GEONET

**SVN 24**

**SVN 13**

**SVN 27**

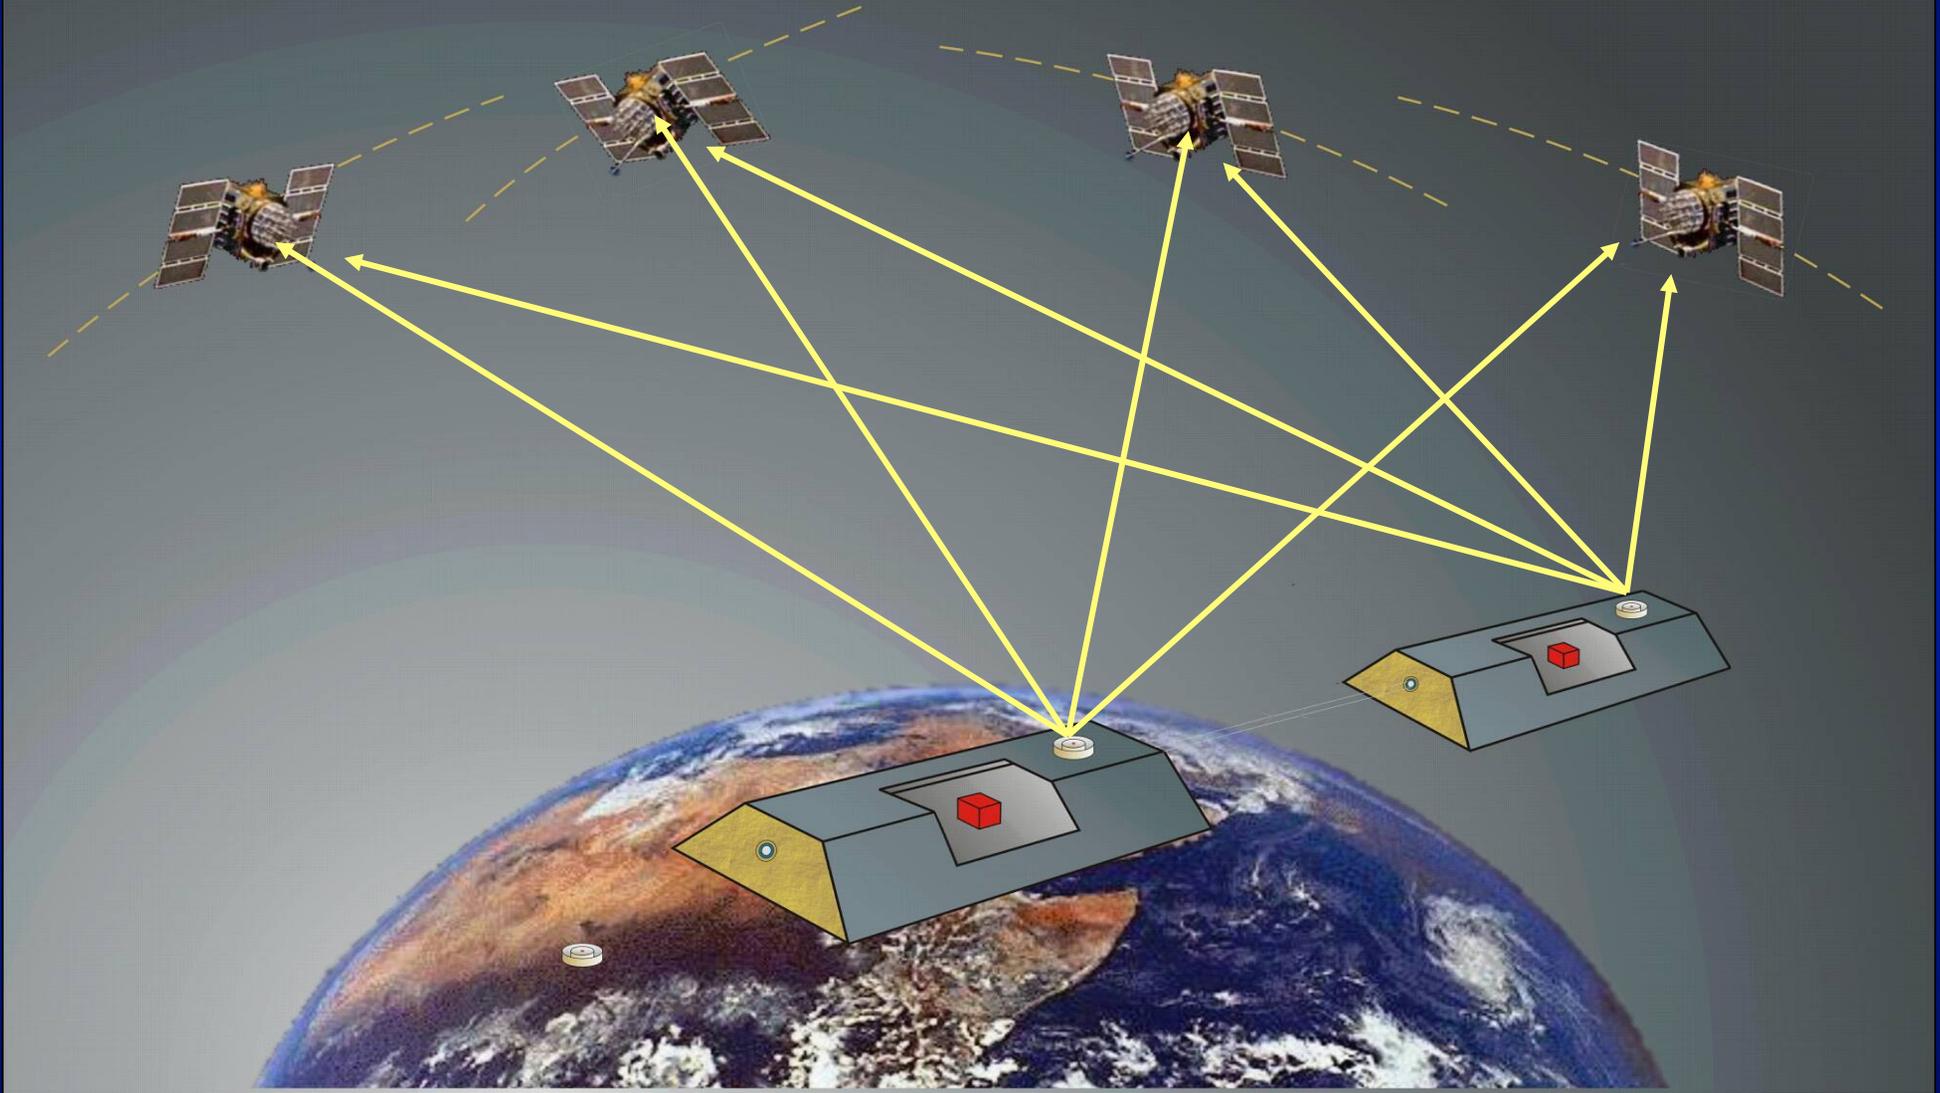

Precursors of large earthquakes [K. Heki, 2011] ?

[K. Heki, 2009]

# Precise Orbit Determination

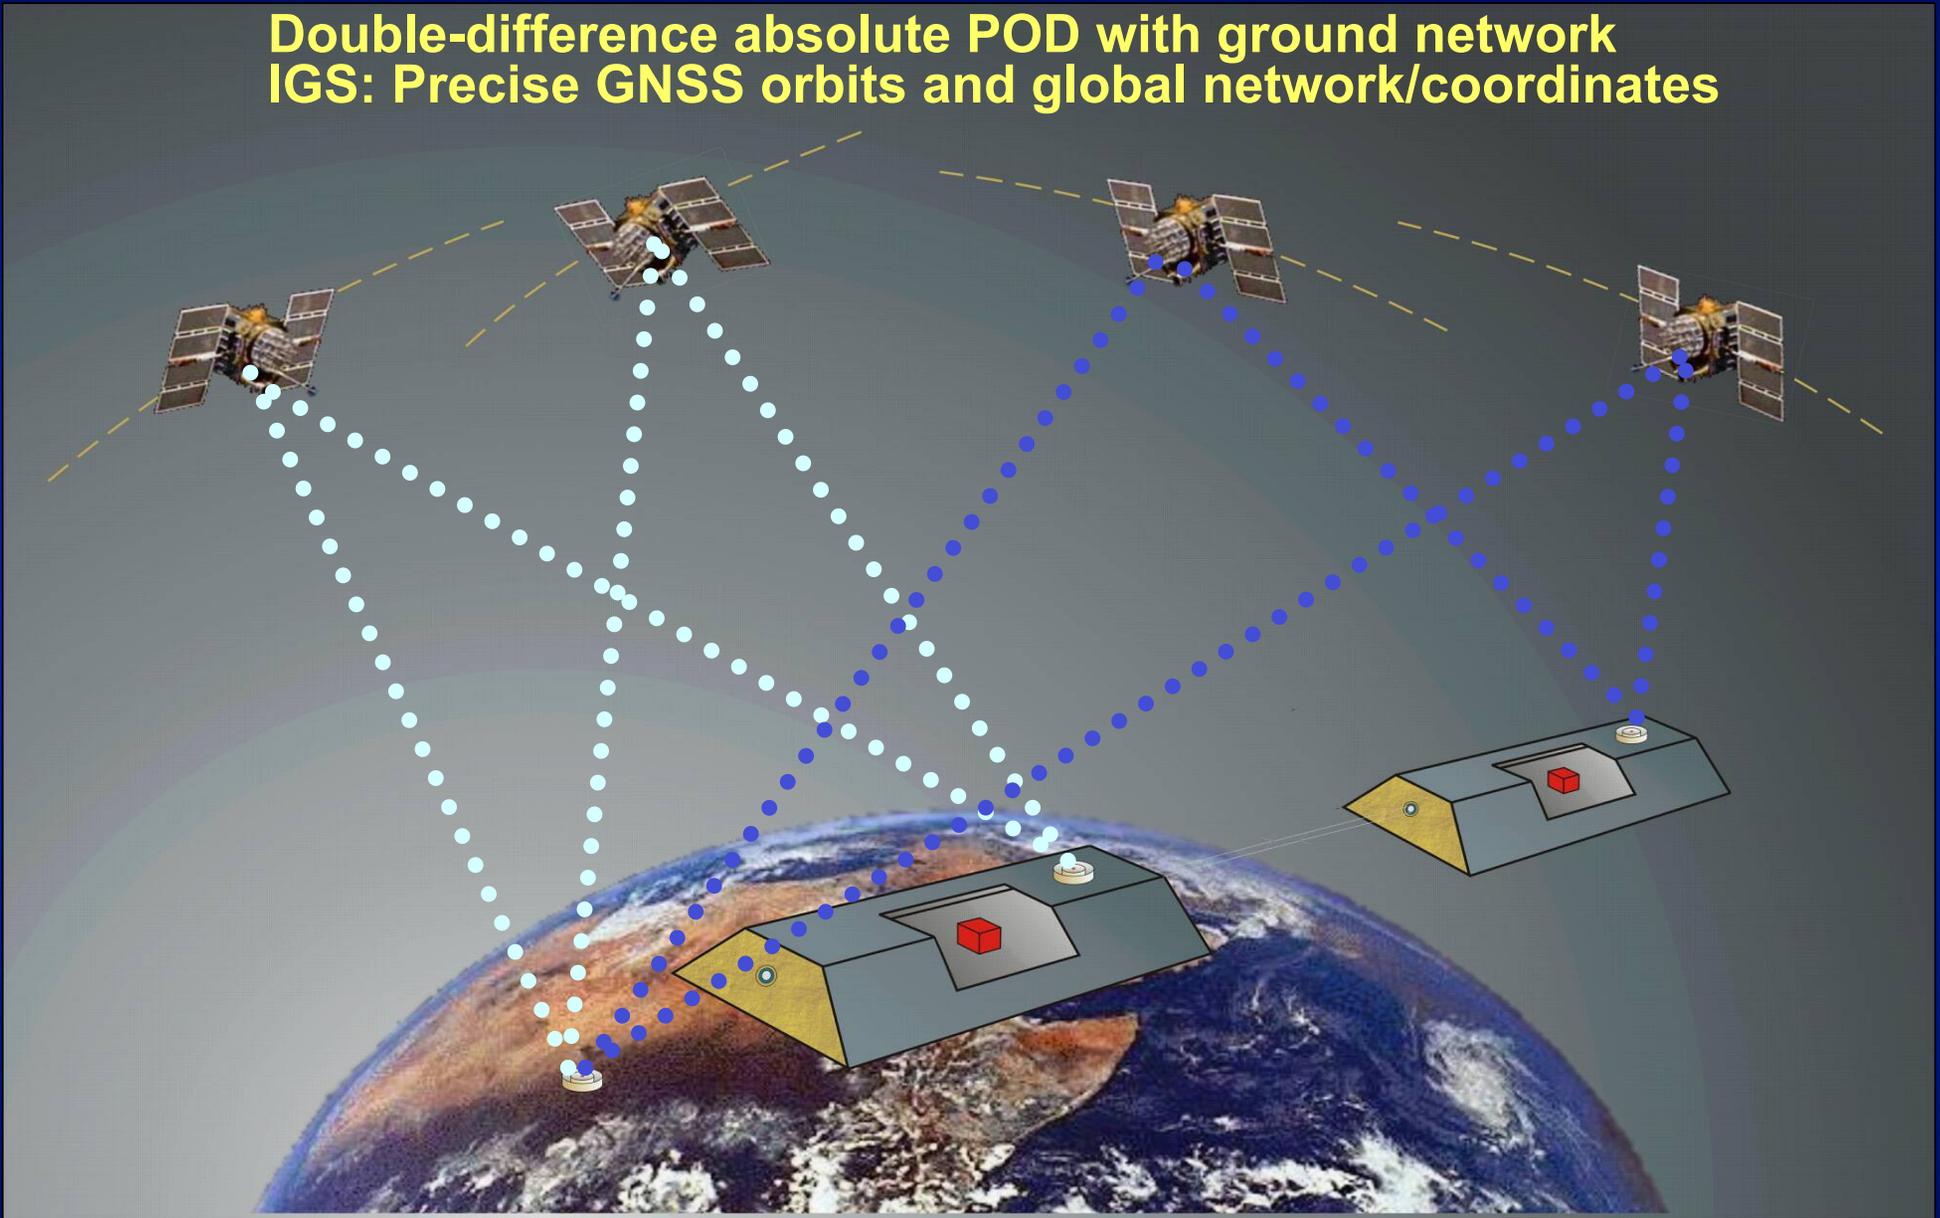

# Precise Orbit Determination Strategies (GRACE)

Zero-difference absolute POD for individual satellites:  
IGS: Precise GNSS orbits and clocks for PPP

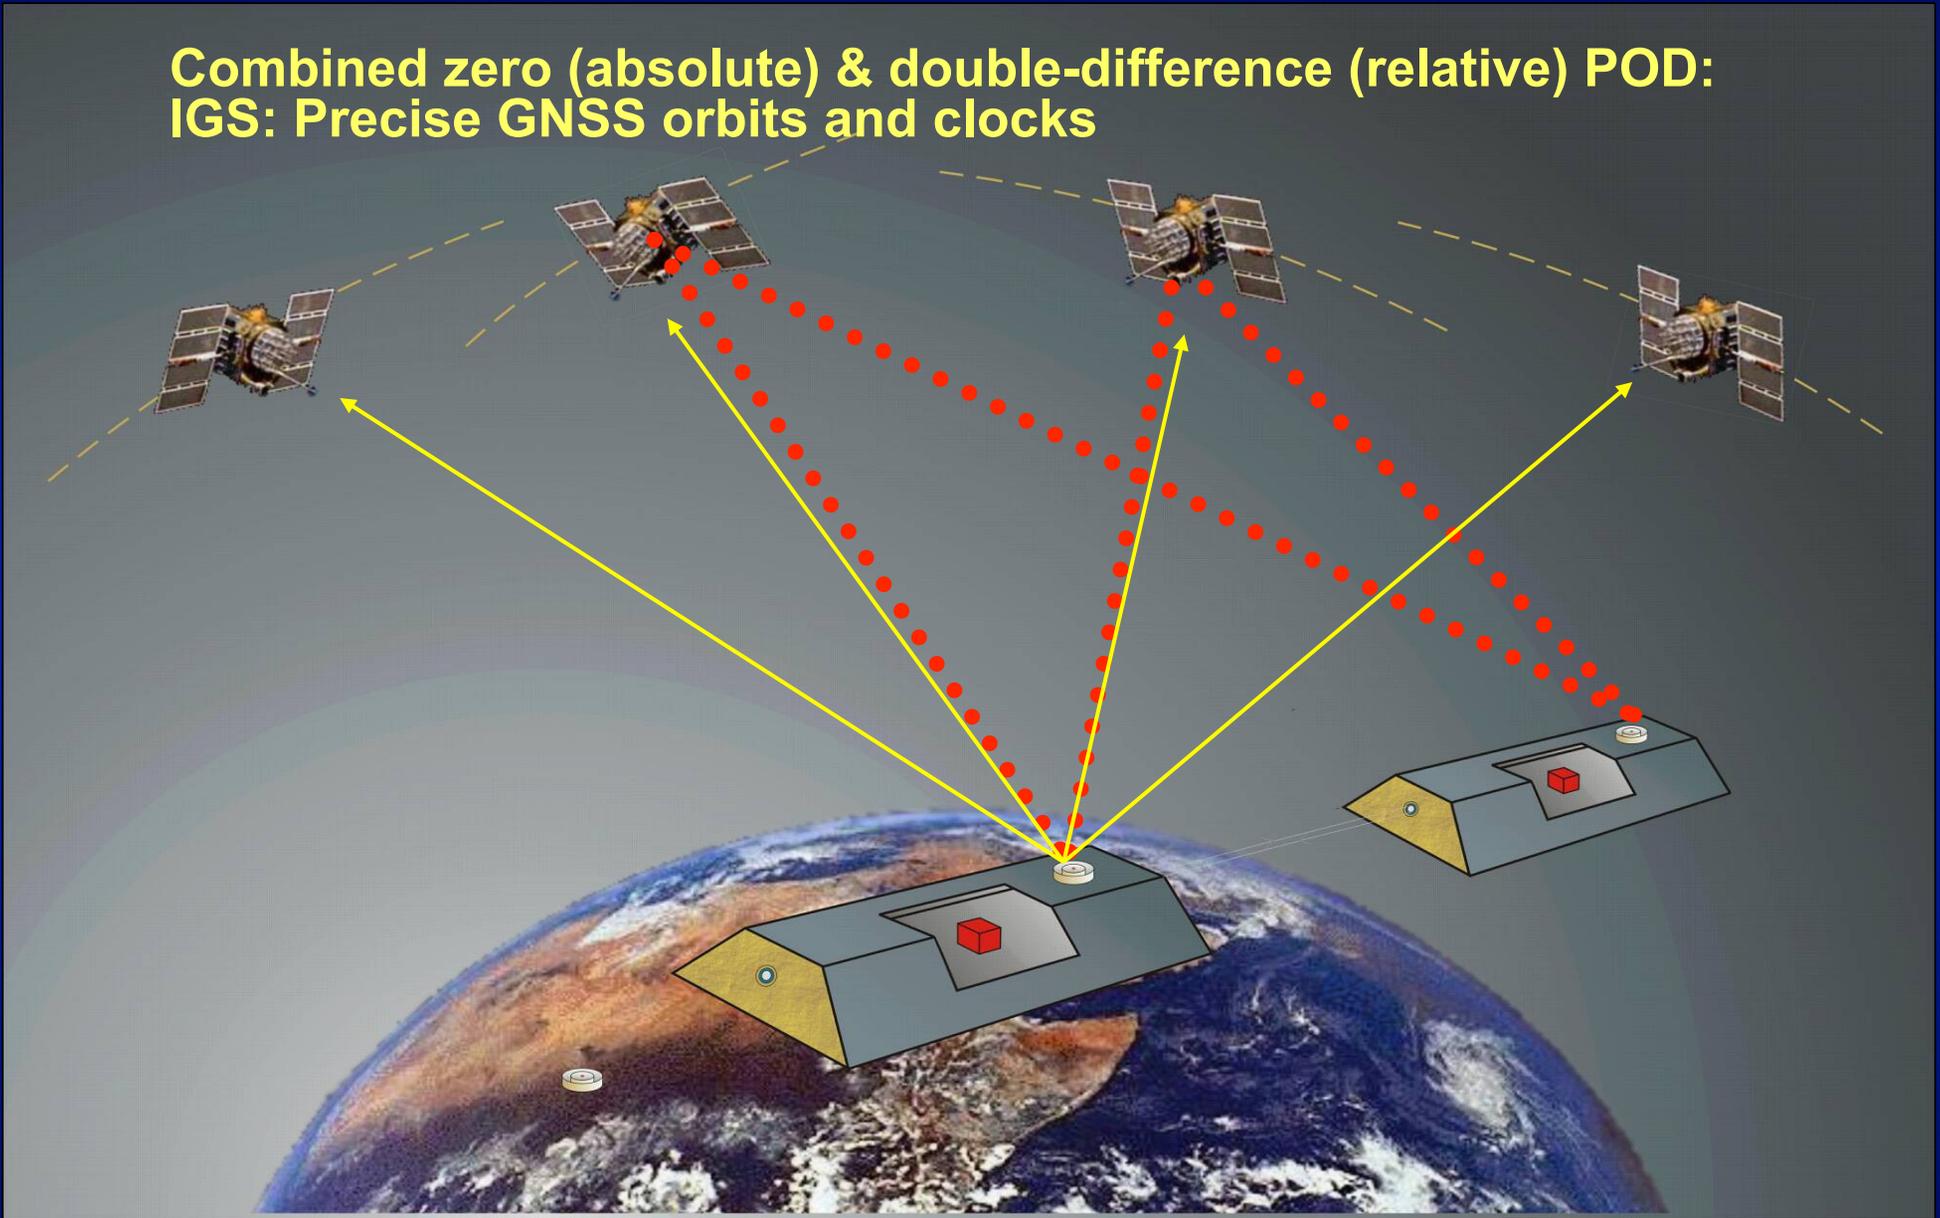

# Precise Orbit Determination Strategies (GRACE)

Double-difference absolute POD with ground network  
IGS: Precise GNSS orbits and global network/coordinates

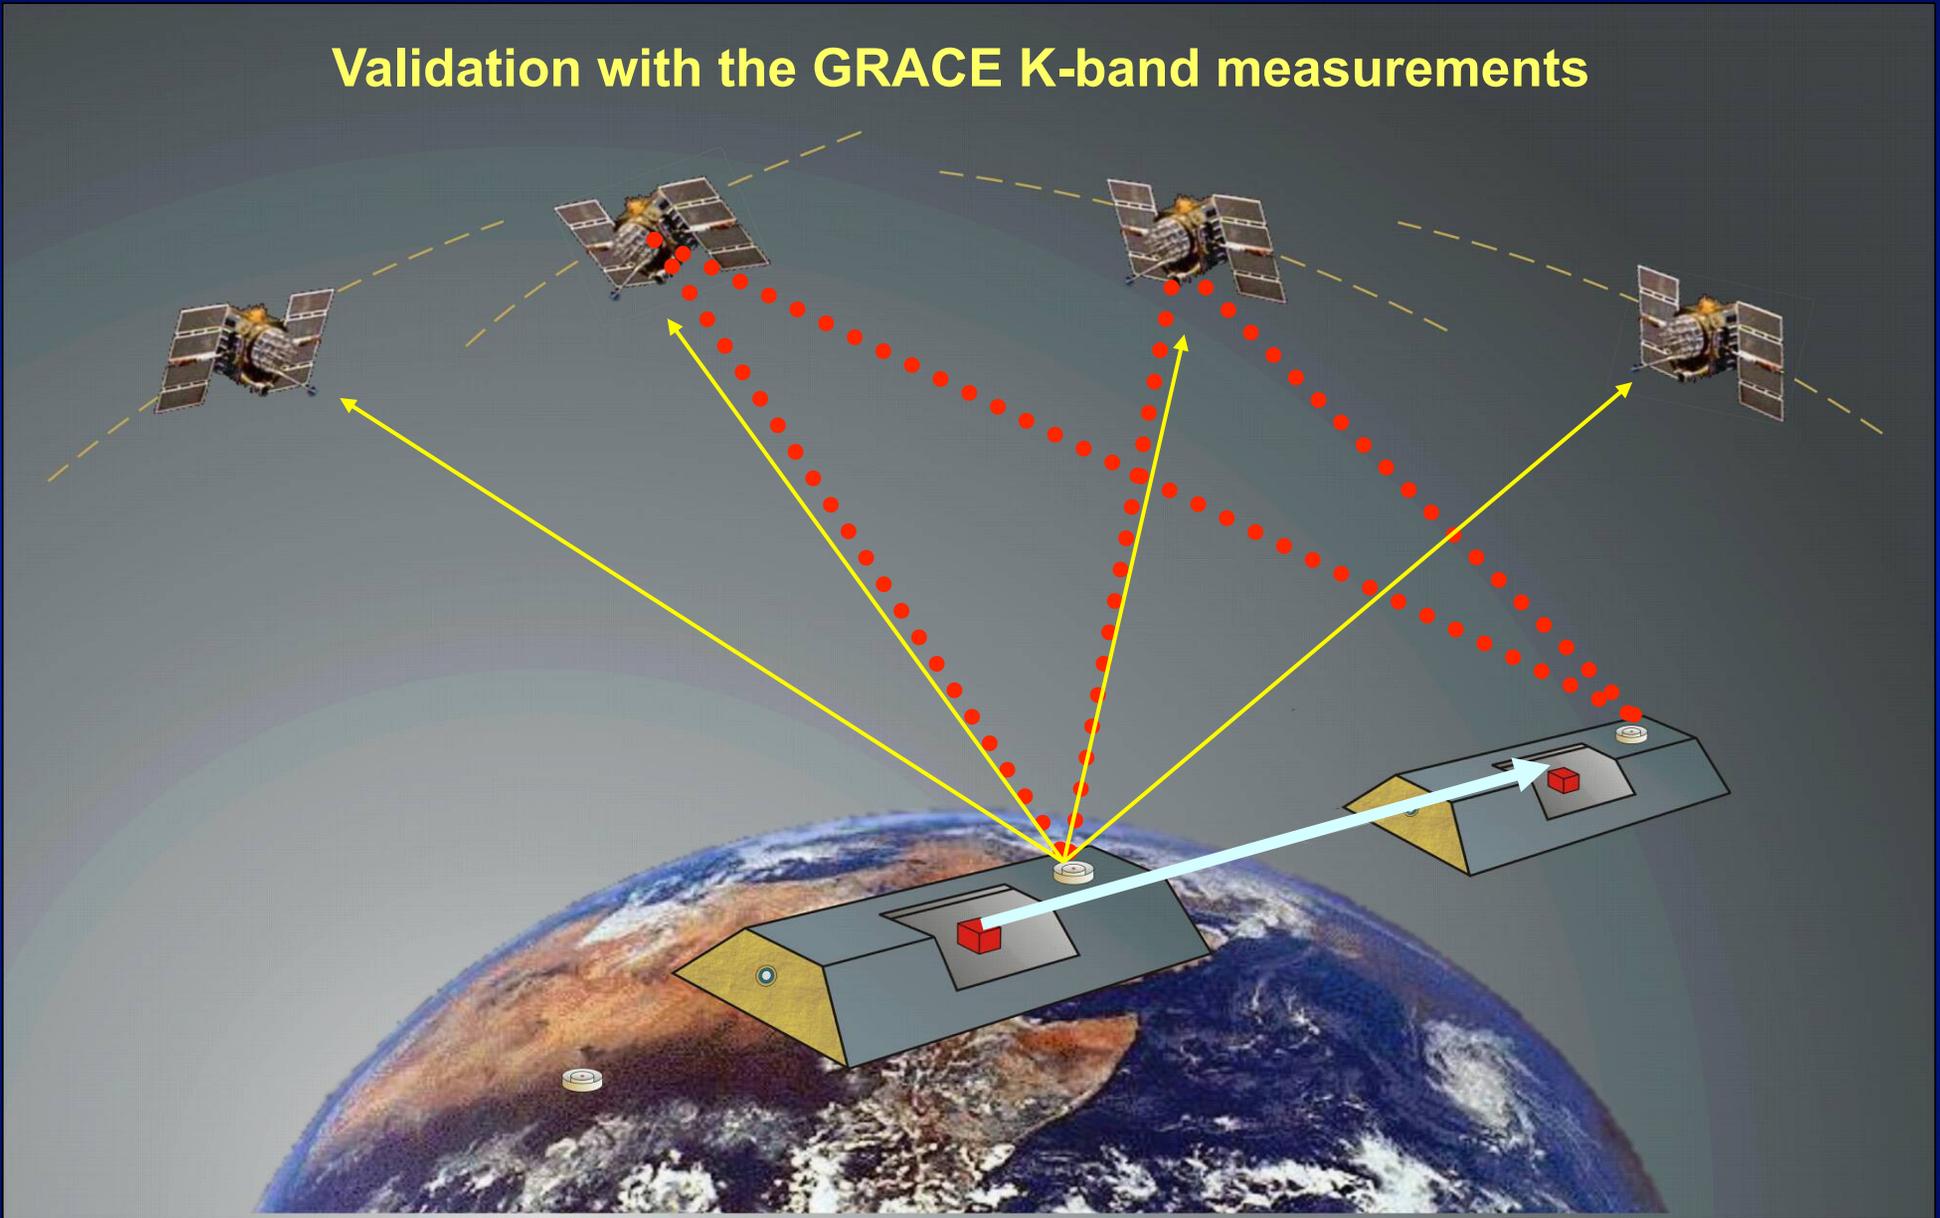

# Precise Orbit Determination Strategies (GRACE)

Combined zero (absolute) & double-difference (relative) POD:  
IGS: Precise GNSS orbits and clocks

# Precise Orbit Determination Strategies (GRACE)

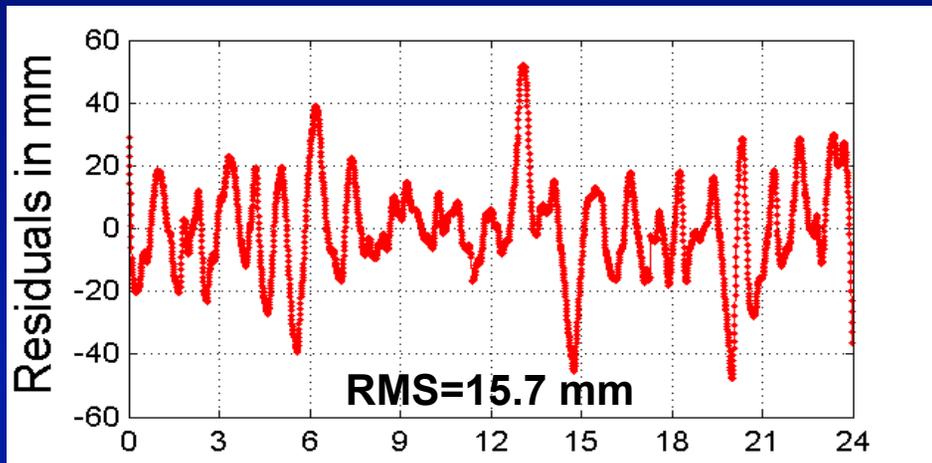

Validation with the GRACE K-band measurements

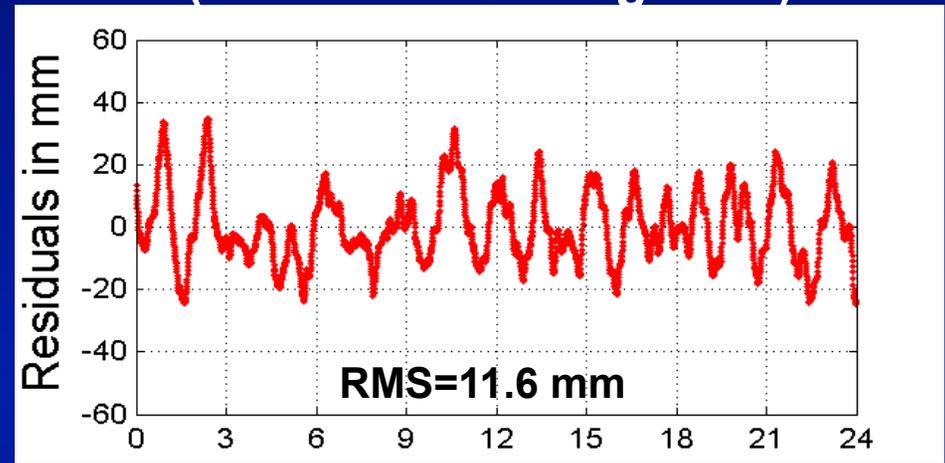

# GRACE Orbits from GPS

## Validation with K-band measurements

**Zero-difference orbits**  
(GRACE A & B separate)

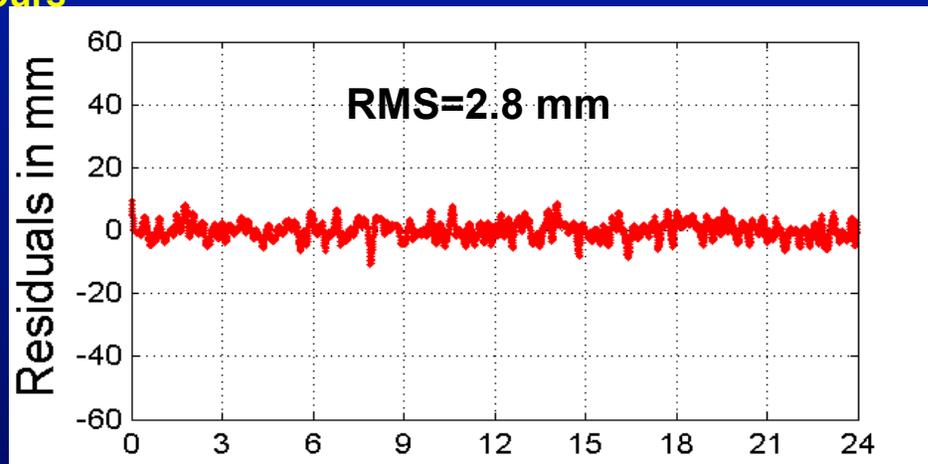

**Baseline with Float ambiguities**  
(GRACE A & B together)

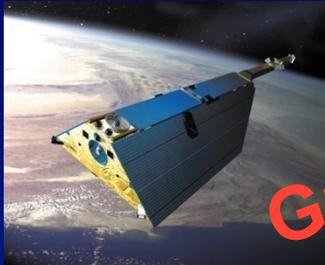

**Baseline with Fixed ambiguities**  
(GRACE A & B together)

[D. Svehla, 2004]

Even more refined methods lead to 1mm accuracies (Montenbruck, Jäggi, ...)

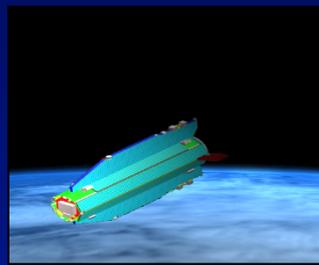

# Precise Orbit Determination enabled by the IGS

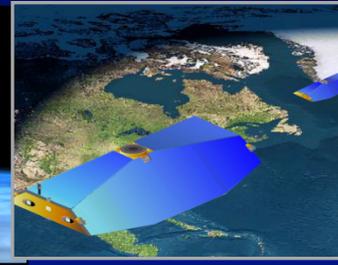

CHAMP

GRACE

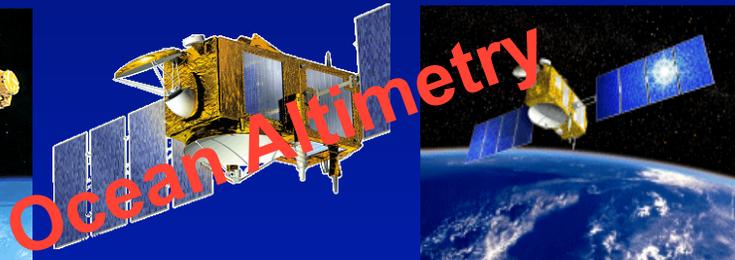

GOCE

GRACE Follow-on ?

...

Topex/Pos.

JASON-1

JASON-2

...

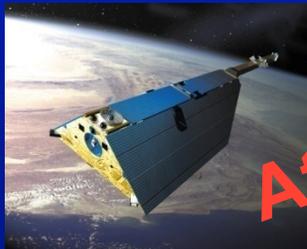

TerraSAR-X

TanDEM-X

...

CHAMP

COSMIC

MetOp

...

Precise orbit determination based on IGS products is a pre-requisite for many satellite mission

IceSat-1

Cryosat-2

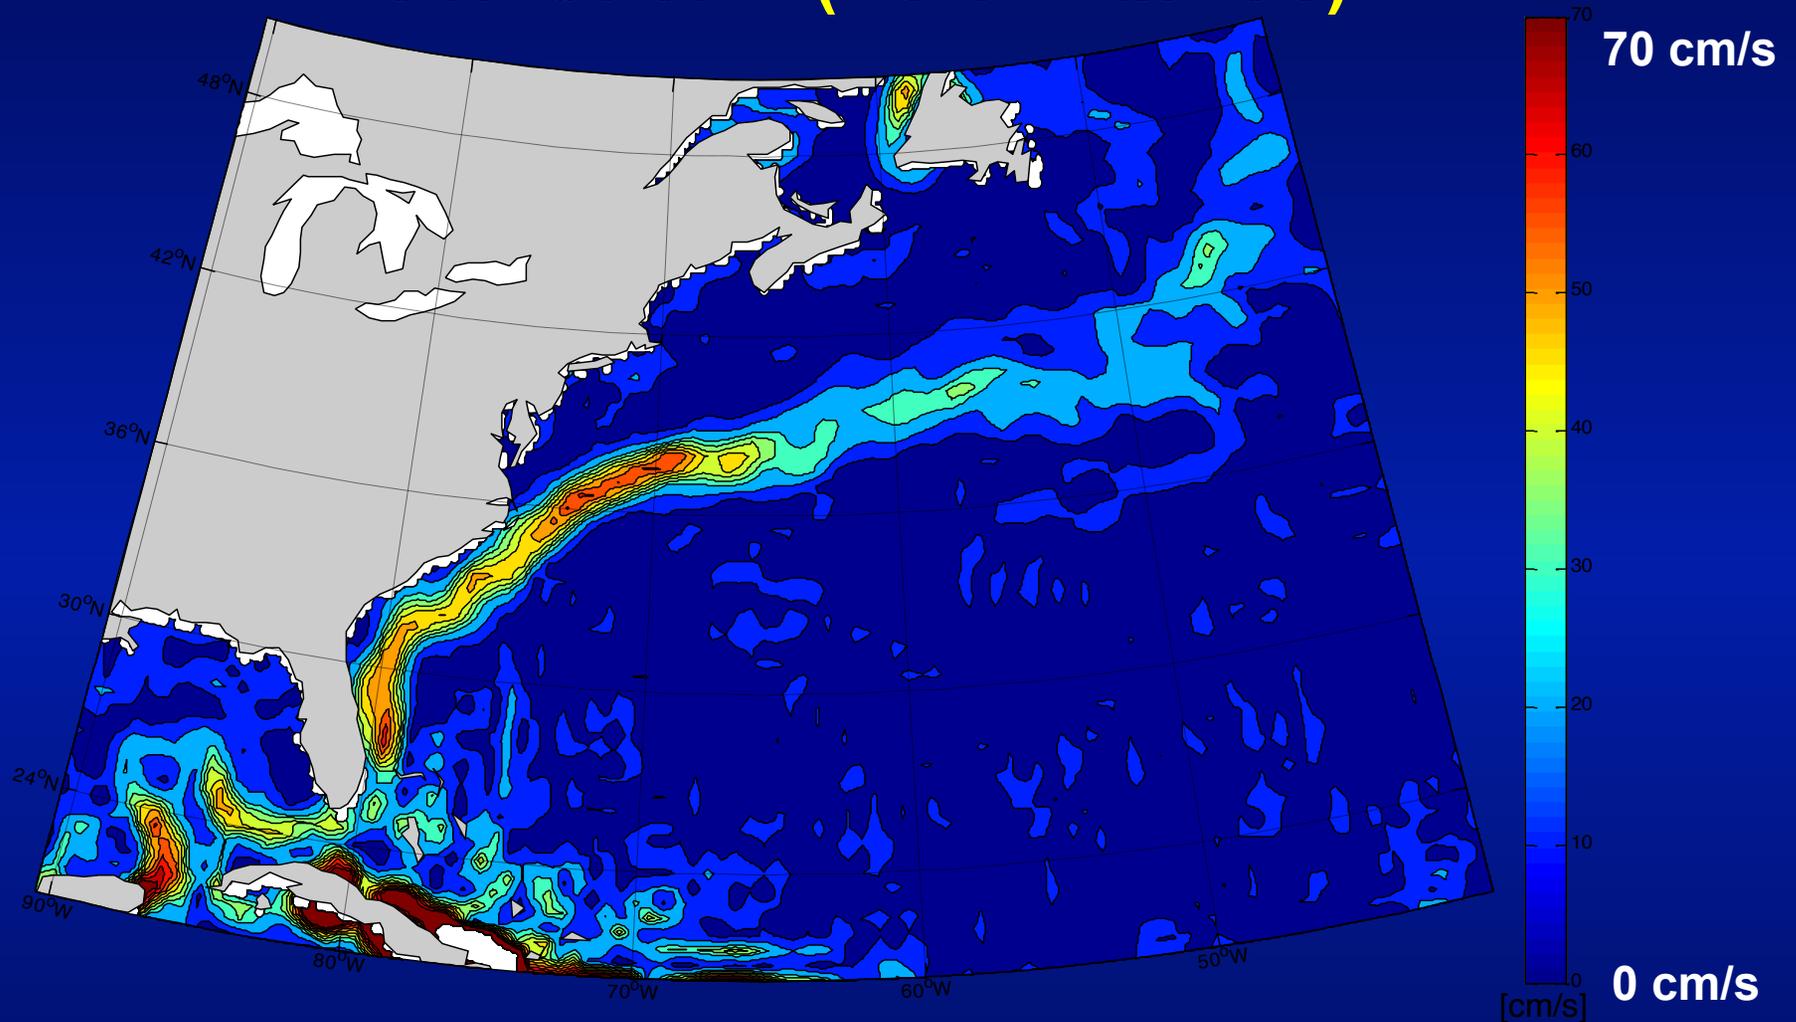

IceSat-2

...

Former IGS WG on LEO POD

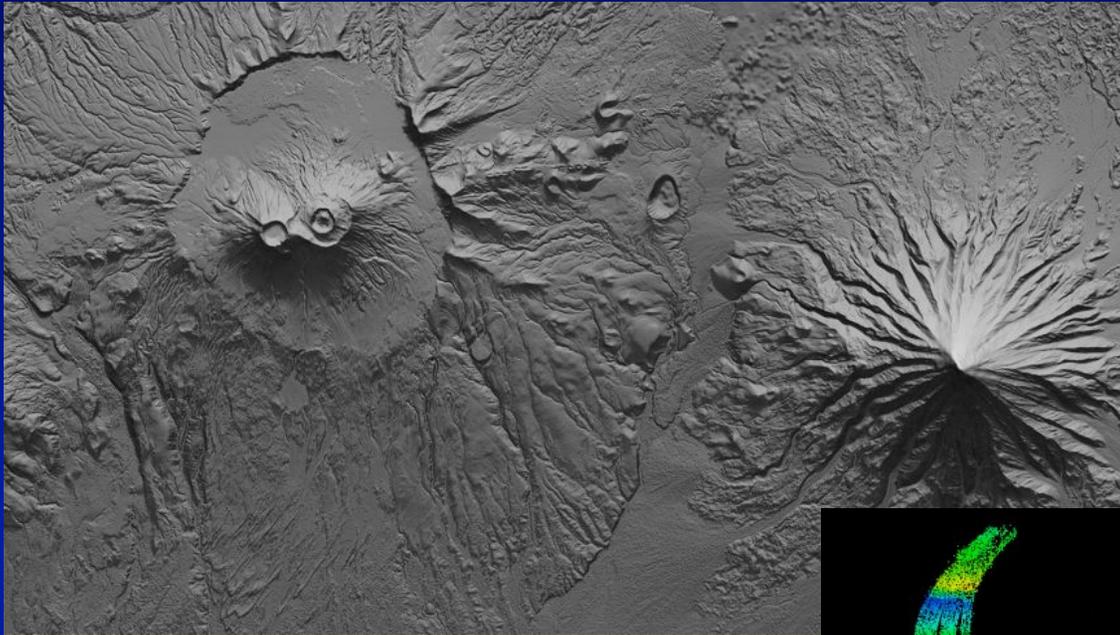

# Example GOCE and Satellite Altimetry: Golf Stream (North Atlantic)

Geostrophic current velocities: difference between GOCE geoid  
and mean sea surface topography from satellite altimetry

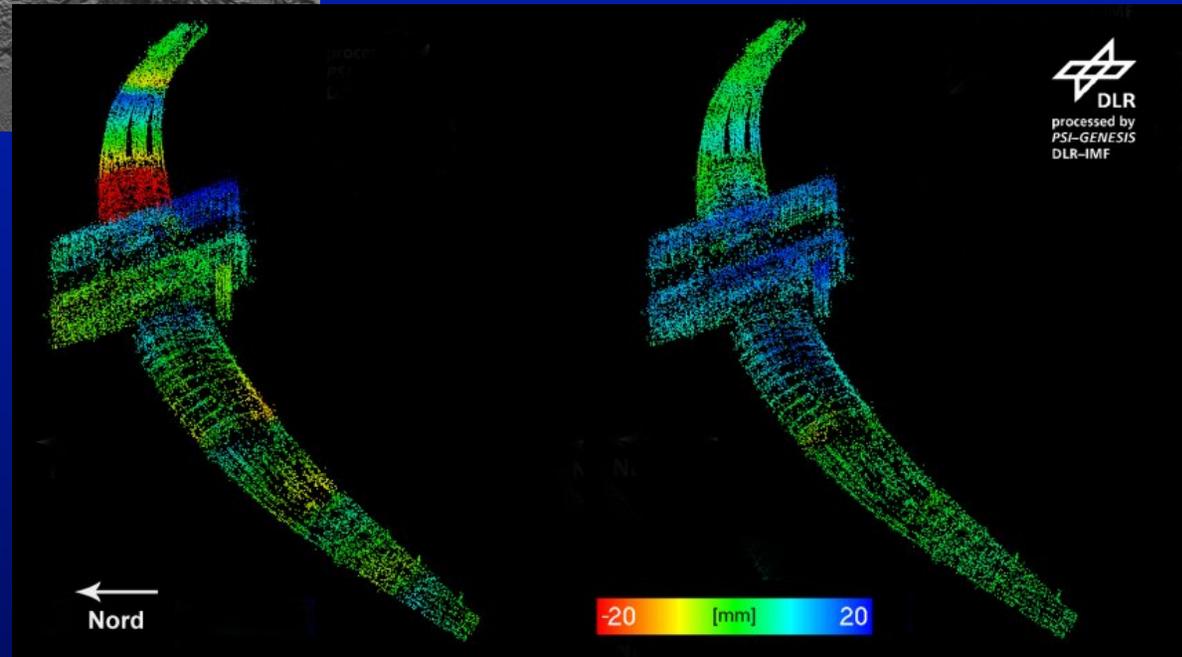

[IAPG, TU Munich]

# Example TanDEM-X – TerraSAR-X: DEMs / Deformation

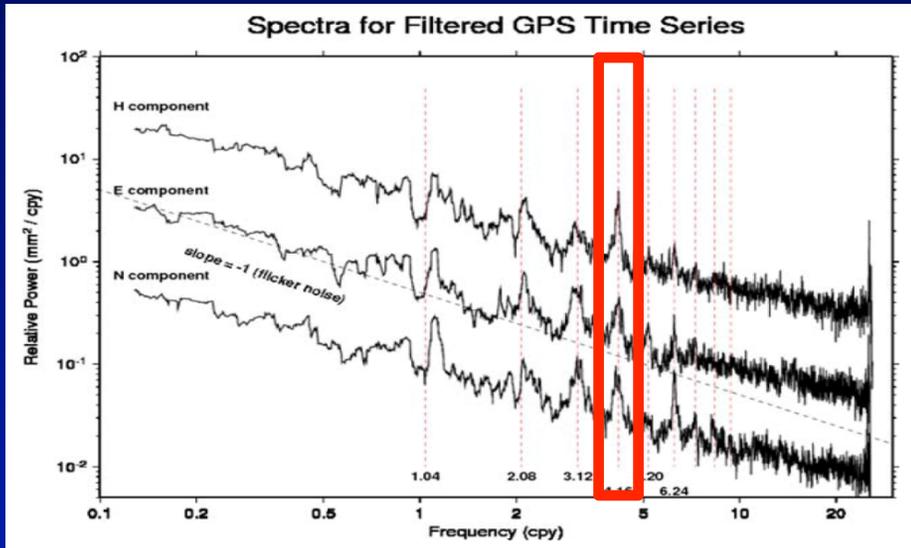

Elevation model of the volcanoes on the Russian Kamchatka Peninsula (image credit: DLR)

New Main Station in Berlin: seasonal deformation due to temperature changes (image credit: DLR)

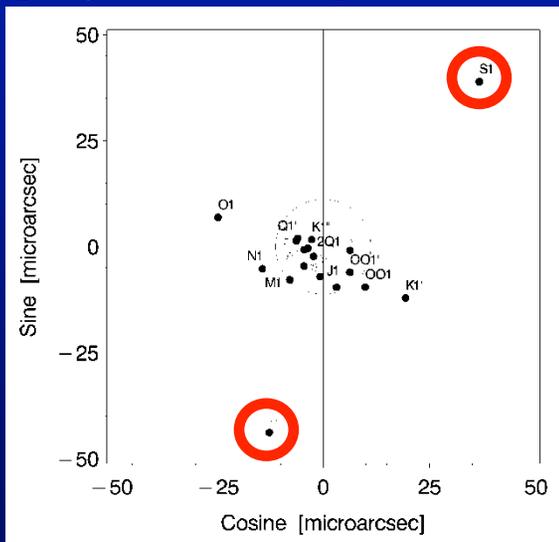

# Challenges for small trends and fast detection

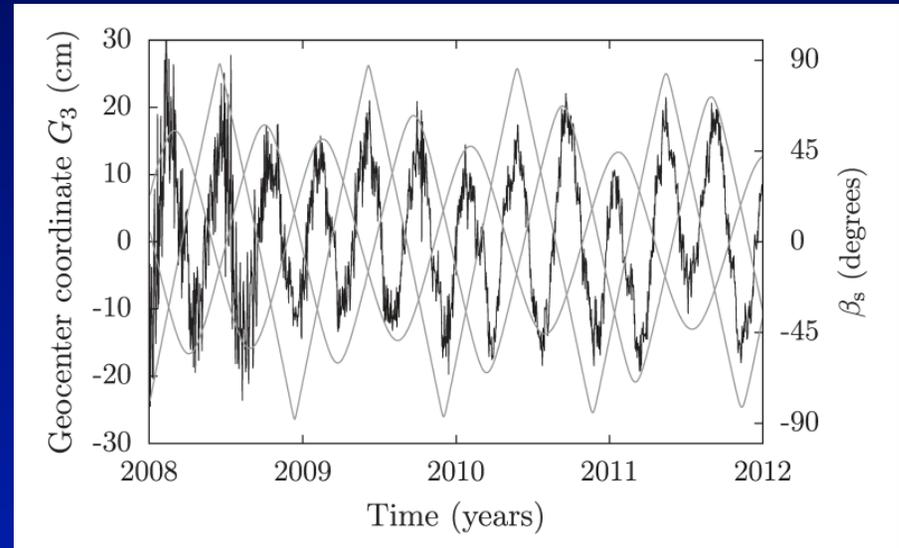

# Small Trends: GNSS Orbit Model Deficiencies

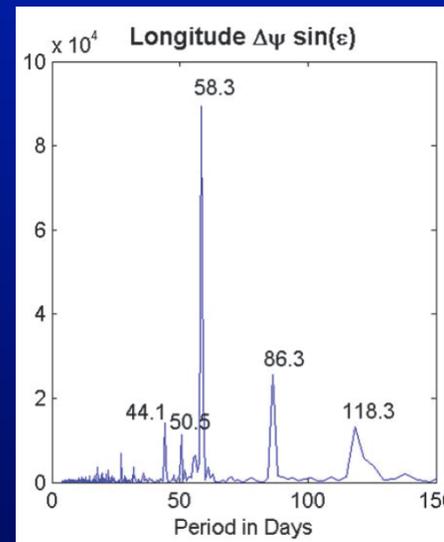

**Draconitic periods in site coordinates**  
[Ray et al., 2007]

**Deviations in ERP tidal terms from GPS around 24 hours**  
[Rothacher et al., 2001]

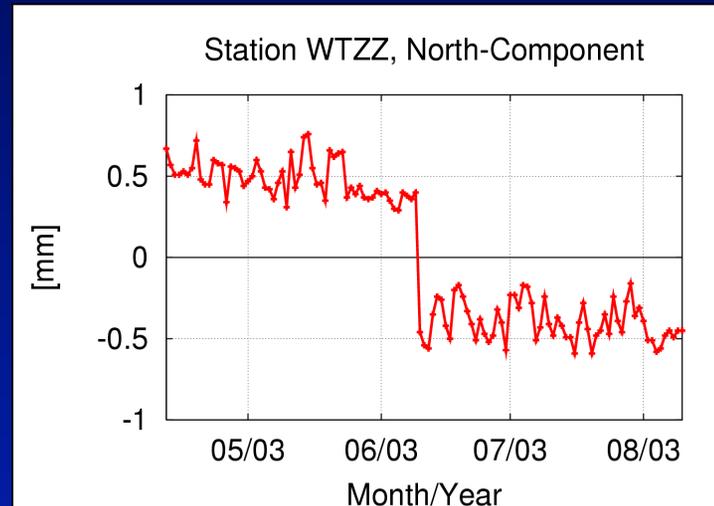

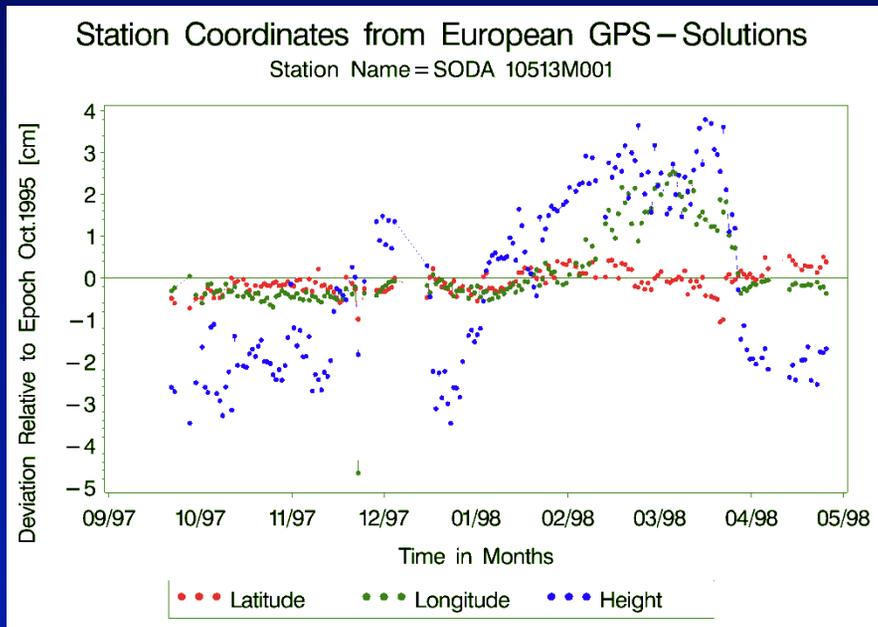

**Draconitic periods in geocenter coordinates from GLONASS** [Meindl et al., 2013]

**Draconitic periods in nutation rates from GPS**  
 $6 \cdot 58.3 \approx 351$  days

→ Detailed modelling, use of high-precision clocks, accelerometers onboard Galileo

# Small Trends: Equipment Changes, Environmental Effects

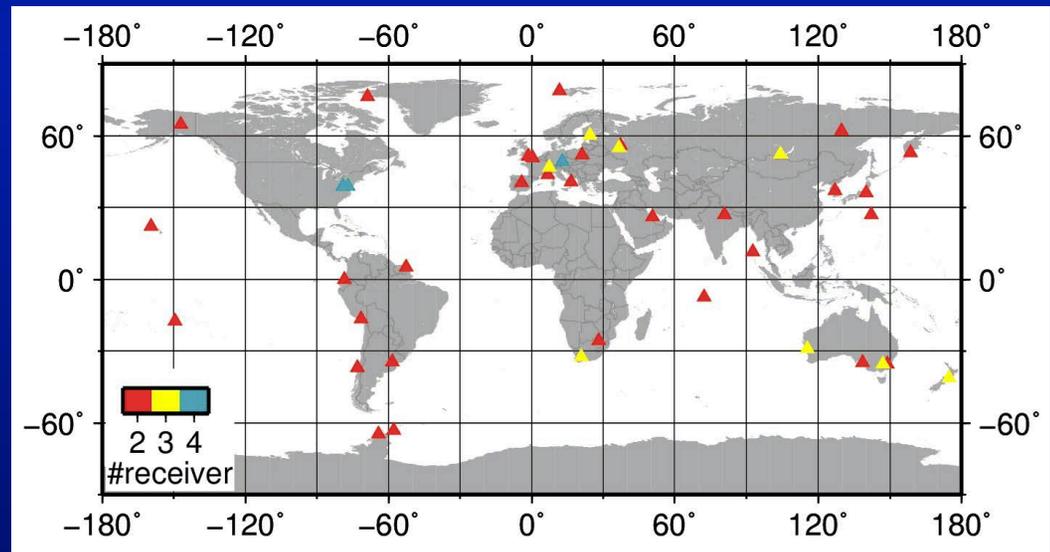

Monitoring with sub-millimeter level (between 0.1-0.2 mm for all comp.)

Finland: snow on the antenna

50% of GNSS sites in ITRF have discontinuities

- 3 antennas/receivers to monitor the relative positions
- P. Steigenberger, T. Herring

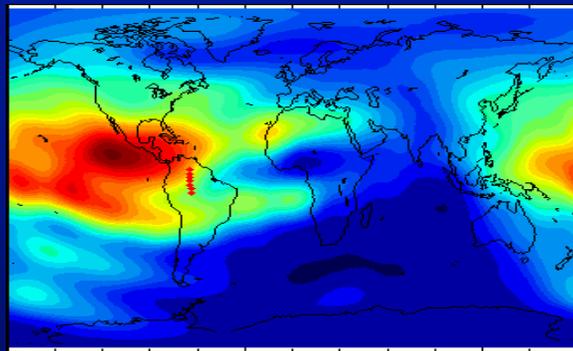

About 40 sites now in the IGS with 2 or more antennas/receivers

# Geodetic GNSS Receivers are not All-Purpose Sensors

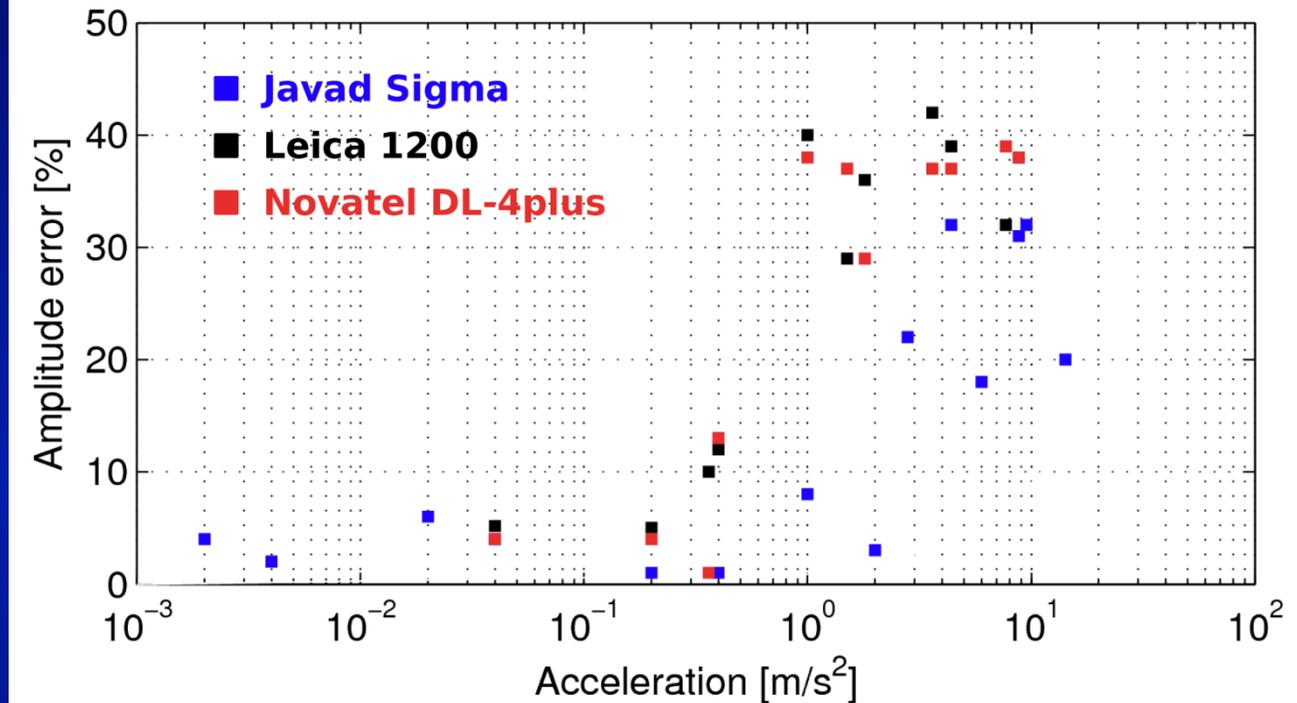

## Shake table results: retrieval of sine signals

Shake table for 1-D earthquake simulation

Ionosphere scintillations

Significant amplitude errors for all receiver types

→ To be considered when equipping IGS sites as part of a **multi-purpose network**

# Conclusions

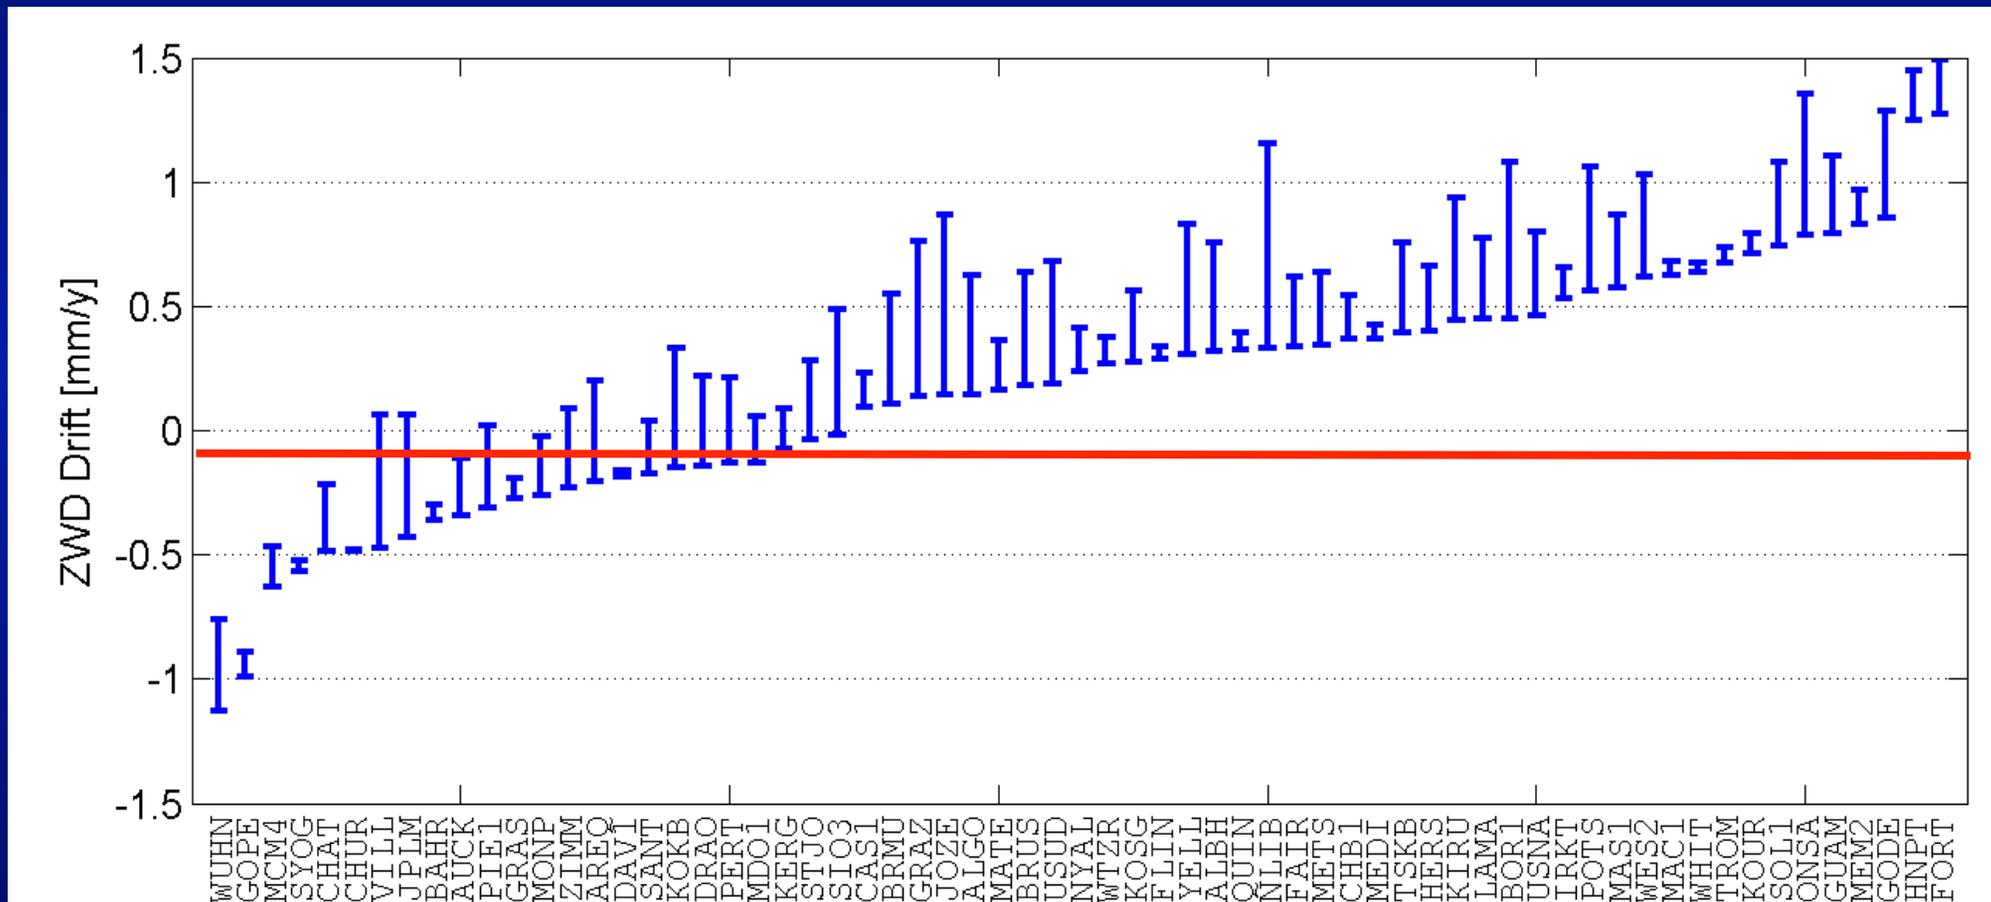

- **Challenges in Earth Observation:**
  - very small, inconspicuous trends (sea level, GIA, ...)
  - very fast events (earthquakes, tsunamis, land slides, ...)
- **IGS enables a large variety of science and Earth monitoring with its diversity of products:**
  - Reprocessing and final products
  - Real-time and ultra-rapid products
- **Challenges in both areas:**
  - GNSS orbit modeling and site discontinuities / environ. Effects
  - Behavior of the GNSS receivers for multi-purpose networks

**Thank you for your attention !**

# Reliable Detection of Small Long-Term Trends

Global change: determination of drifts in the zenith wet delay from GNSS for a global network ( $N_{ZD} > 40,000$ )

→ Reprocessing effort extremely important

[P. Steigenberger, 2007]
